# CHAPTER 1

---

## Changelog

---

This page shows the main changes from AS3 to AS4.

Major mentions:

- Python version has changed to 3.7.3 instead of 2.7.
- Configuration language has changed to YAML.
- All parameters are now unified into a single dictionary.
- All sections are now uppercase.
- All parameters, except for job related ones, have now an hierarchy.
- A special key, FOR:, has been added. This key allows to create multiple jobs with almost the same configuration.
- The configuration of autosubmit is now more flexible.
- New command added, updateproj. This command will update all the scripts and autosubmit configuration.
- Wrapper definition has changed.
- Tasks dependencies system has changed.

**Warning:** updateproj may not translate all the scripts, we recommend to revise your scripts before run AS.

## 1.1 Configuration changes

Now autosubmit is composed by two kind of YAML configurations, the default ones, which are the same as always, and the custom ones.

The custom ones, allows to define custom configurations that will override the default ones, in order to do this, you only have to put the key in the custom configuration file. These custom ones, can be anywhere and have any name, by default they're inside `<expid>/conf` but you can change this path in the `expdef.yml` file. `DEFAULT_CUSTOM_CONFIG_DIR`

Additionally, you must be aware of the following changes:

- All sections **keys** are normalized to **UPPERCASE**, while values remain as the user put. Beware of the scripts that relies on %CURRENT\_HPCARCH% and variables that refer to a platform because they will be always in **UPPERCASE**. Normalize the script.
- To define a job, you must put them under the key *jobs* in any custom configuration file.
- To define a platform, you must put them under the key *platforms* in any custom configuration file.
- To define a loop, you must put the key “FOR” as the first key of the section.
- You can put any %placeholder% in the proj.conf and custom files, and also you can put %ROOTDIR% in the expdef.yml.
- All configuration is now based in an hierarchical structure, so to export a var, you must use the following syntax: %KEY.SUBKEY.SUBSUBKEY%. The same goes for override them.
- YAML has into account the type.

## 1.2 Examples

List of example with the new configuration and the structure as follows

```
$/autosubmit/a00q/conf$ ls
autosubmit_a00q.yml  custom_conf  expdef_a00q.yml  jobs_a00q.yml  platforms_a00q.yml
$/autosubmit/a00q/conf/custom_conf ls
more_jobs.yml
```

### 1.2.1 Configuration

*autosubmit\_expid.yml*

```
config:
  AUTOSUBMIT_VERSION: 4.0.0b
  MAXWAITINGJOBS: '3000'
  TOTALJOBS: '3000'

```

## 1.2.2 Wrappers definition

To define a the wrappers:

```
wrappers:
  wrapper_sim20:
    TYPE: "vertical"
    JOBS_IN_WRAPPER: "SIM_20"
  wrapper_sim40:
    TYPE: "vertical"
    JOBS_IN_WRAPPER: "SIM_40"
```

## 1.2.3 Loops definition

To define a loop, you need to use the FOR key and also the NAME key.

In order to generate the following jobs:

```
POST_20:
  FILE: POST.sh
  RUNNING: chunk
  WALLCLOCK: '00:05'
  PROCESSORS: 20
  THREADS: 1
  DEPENDENCIES: SIM_20 POST_20-1
POST_40:
  FILE: POST.sh
  RUNNING: chunk
  WALLCLOCK: '00:05'
  PROCESSORS: 40
  THREADS: 1
  DEPENDENCIES: SIM_40 POST_40-1
POST_80:
  FILE: POST.sh
  RUNNING: chunk
  WALLCLOCK: '00:05'
  PROCESSORS: 80
  THREADS: 1
  DEPENDENCIES: SIM_80 POST_80-1
```

One can use now the following configuration:

```
POST:
  FOR:
    NAME: [ 20, 40, 80 ]
    PROCESSORS: [ 20, 40, 80 ]
    THREADS: [ 1,1,1 ]
    DEPENDENCIES: [ SIM_20 POST_20-1, SIM_40 POST_40-1, SIM_80 POST_80-1 ]
  FILE: POST.sh
  RUNNING: chunk
  WALLCLOCK: '00:05'
```

**Warning:** Only the parameters that changes must be included inside the *FOR* key.

## 1.3 DEPENDENCIES

The DEPENDENCIES key is used to define the dependencies of a job. It can be used in the following ways:

- Basic: The dependencies are a list of jobs, separated by ” “, that runs before the current task is submitted.
- New: The dependencies is a list of YAML sections, separated by “n”, that runs before the current job is submitted.
  - For each dependency section, you can designate the following keywords to control the current job-affected tasks
    - \* DATES\_FROM: Selects the job dates that you want to alter.
    - \* MEMBERS\_FROM: Selects the job members that you want to alter.
    - \* CHUNKS\_FROM: Selects the job chunks that you want to alter.
  - For each dependency section and \*\_FROM keyword, you can designate the following keywords to control the dependency tasks
    - \* DATES\_TO: Links current selected tasks to the dependency tasks of the dates specified.
    - \* MEMBERS\_TO: Links current selected tasks to the dependency tasks of the members specified.
    - \* CHUNKS\_TO: Links current selected tasks to the dependency tasks of the chunks specified.
  - Important keywords for [DATES|MEMBERS|CHUNKS]\_TO:
    - \* “natural”: Will keep the default linkage.
    - \* “all”: Will link selected tasks of the dependency with current selected tasks.
    - \* “none”: Will unlink selected tasks of the dependency with current selected tasks.

For the new format, consider that the priority is hierarchy and goes like this DATES\_FROM -(includes)-> MEMBERS\_FROM -(includes)-> CHUNKS\_FROM.

- You can define a DATES\_FROM inside the DEPENDENCY.
- You can define a MEMBERS\_FROM inside the DEPENDENCY and DEPENDENCY.DATES\_FROM.
- You can define a CHUNKS\_FROM inside the DEPENDENCY, DEPENDENCY.DATES\_FROM, DEPENDENCY.MEMBERS\_FROM, DEPENDENCY.DATES\_FROM.MEMBERS\_FROM

For the examples, we will consider that our experiment has the following configuration:

<b>EXPERIMENT :</b>
<b>DATELIST:</b> 202201[01-02]
<b>MEMBERS:</b> FC1 FC2
<b>NUMCHUNKS:</b> 4

### 1.3.1 Basic

```
JOBs:  
JOB_1:  
    FILE: job1.sh  
    RUNNING: chunk  
JOB_2:  
    FILE: job2.sh  
    DEPENDENCIES: JOB_1  
    RUNNING: chunk  
JOB_3:  
    FILE: job3.sh  
    DEPENDENCIES: JOB_2  
    RUNNING: chunk  
SIM:  
    FILE: sim.sh  
    DEPENDENCIES: JOB_3 SIM-1  
    RUNNING: chunk  
POST:  
    FILE: post.sh  
    DEPENDENCIES: SIM  
    RUNNING: chunk  
TEST:  
    FILE: test.sh  
    DEPENDENCIES: POST  
    RUNNING: chunk
```

### 1.3.2 New format

```
JOBs:  
JOB_1:  
    FILE: job1.sh  
    RUNNING: chunk  
JOB_2:  
    FILE: job2.sh  
    DEPENDENCIES:  
        JOB_1:  
            dates_to: "natural"  
            members_to: "natural"  
            chunks_to: "natural"  
    RUNNING: chunk  
JOB_3:  
    FILE: job3.sh  
    DEPENDENCIES:  
        JOB_2:  
            dates_to: "natural"  
            members_to: "natural"  
            chunks_to: "natural"  
    RUNNING: chunk  
SIM:  
    FILE: sim.sh  
    DEPENDENCIES:  
        JOB_3:  
            dates_to: "natural"  
            members_to: "natural"  
            chunks_to: "natural"  
        SIM-1:
```

(continues on next page)

(continued from previous page)

```

dates_to: "natural"
members_to: "natural"
chunks_to: "natural"

RUNNING: chunk
POST:
FILE: post.sh
DEPENDENCIES:
SIM:
dates_to: "natural"
members_to: "natural"
chunks_to: "natural"

RUNNING: chunk
TEST:
FILE: test.sh
DEPENDENCIES:
POST:
dates_to: "natural"
members_to: "natural"
chunks_to: "natural"

RUNNING: chunk

```

### 1.3.3 Example 1: New format with specific dependencies

```

JOBS:
JOB_1:
FILE: job1.sh
RUNNING: chunk
JOB_2:
FILE: job2.sh
DEPENDENCIES:
JOB_1:
dates_to: "natural"
members_to: "natural"
chunks_to: "natural"

RUNNING: chunk
JOB_3:
FILE: job3.sh
DEPENDENCIES:
JOB_2:
dates_to: "natural"
members_to: "natural"
chunks_to: "natural"

RUNNING: chunk
SIM:
FILE: sim.sh
DEPENDENCIES:
JOB_3:
SIM-1:
SIM:
MEMBERS_FROM:
FC2:
CHUNKS_FROM:
1:
dates_to: "all"
members_to: "FC1"

```

(continues on next page)

(continued from previous page)

```
    chunks_to: "4"
  RUNNING: chunk
POST:
  FILE: post.sh
DEPENDENCIES:
  SIM:
  RUNNING: chunk
TEST:
  FILE: test.sh
DEPENDENCIES:
  POST:
    members_to: "FC2"
    chunks_to: 4
  RUNNING: once
```

# too add img

# CHAPTER 2

---

## Introduction

---

### 2.1 What is Autosubmit ?

Autosubmit is a python-based workflow manager to create, manage and monitor experiments by using Computing Clusters, HPC's and Supercomputers remotely via ssh. It has support for experiments running in more than one HPC and for different workflow configurations.

Autosubmit is currently used at Barcelona Supercomputing Centre (BSC) to run models (EC-Earth, MONARCH, NEMO, CALIOPE, HERMES...), operational toolchains (S2S4E), data-download workflows (ECMWF MARS), and many other.

Autosubmit has been used to manage models running at supercomputers in BSC, ECMWF, IC3, CESGA, EPCC, PDC and OLCF.

Autosubmit is now available via PyPi package under the terms of GNU General Public License.

Get involved or contact us:

GitLab:	<a href="https://earth.bsc.es/gitlab/es/autosubmit">https://earth.bsc.es/gitlab/es/autosubmit</a>
Mail:	<a href="mailto:support-autosubmit@bsc.es">support-autosubmit@bsc.es</a>

### 2.2 Why is Autosubmit needed ?

Autosubmit is the only existing tool that satisfies the following requirements from the weather and climate community:

- **Automatisation** Job submission to machines and dependencies between jobs are managed by Autosubmit. No user intervention is needed.
- **Data provenance** Assigns unique identifiers for each experiment and stores information about model version, experiment configuration and computing facilities used in the whole process.
- **Failure tolerance** Automatic retrials and ability to rerun chunks in case of corrupted or missing data.

- **Resource management** Autosubmit manages supercomputer particularities, allowing users to run their experiments in the available machine without having to adapt the code. Autosubmit also allows to submit tasks from the same experiment to different platforms.

## 2.3 How does Autosubmit work ?

You can find help about how to use autosubmit and a list of available commands, just executing:

```
autosubmit -h
```

Execute autosubmit <command> -h for detailed help for each command:

```
autosubmit expid -h
```

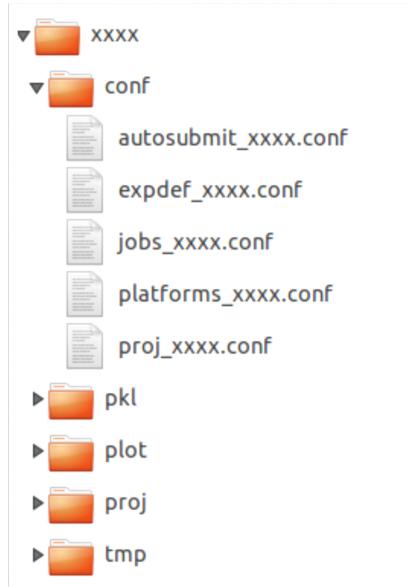

### 2.3.1 Experiment creation

To create a new experiment, run the command:

```
autosubmit expid -H HPCname -d Description
```

*HPCname* is the name of the main HPC platform for the experiment: it will be the default platform for the tasks. *Description* is a brief experiment description.

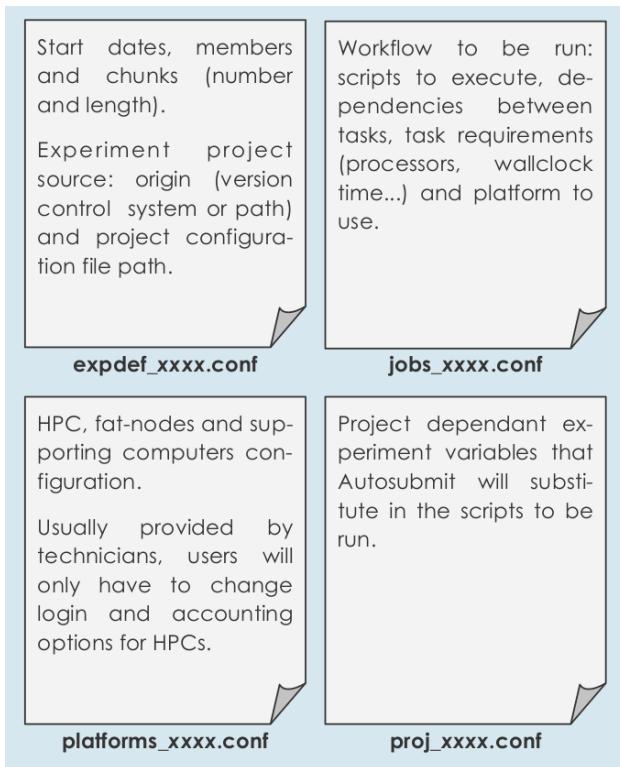

This command assigns a unique four character identifier (xxxx, names starting from a letter, the other three characters) to the experiment and creates a new folder in experiments repository with structure shown in Figure 2.1.

2.1: Example of an experiment directory tree.

### 2.3.2 Experiment configuration

To configure the experiment, edit `expdef_xxxx.conf`, `jobs_xxxx.conf` and `platforms_xxxx.conf` in the `conf` folder of the experiment (see contents in Figure 2.2).

2.2: Configuration files content

After that, you are expected to run the command:

```
autosubmit create xxxx
```

This command creates the experiment project in the `proj` folder. The experiment project contains the scripts specified in `jobs_xxxx.conf` and a copy of model source code and data specified in `expdef_xxxx.conf`.

### 2.3.3 Experiment run

To run the experiment, just execute the command:

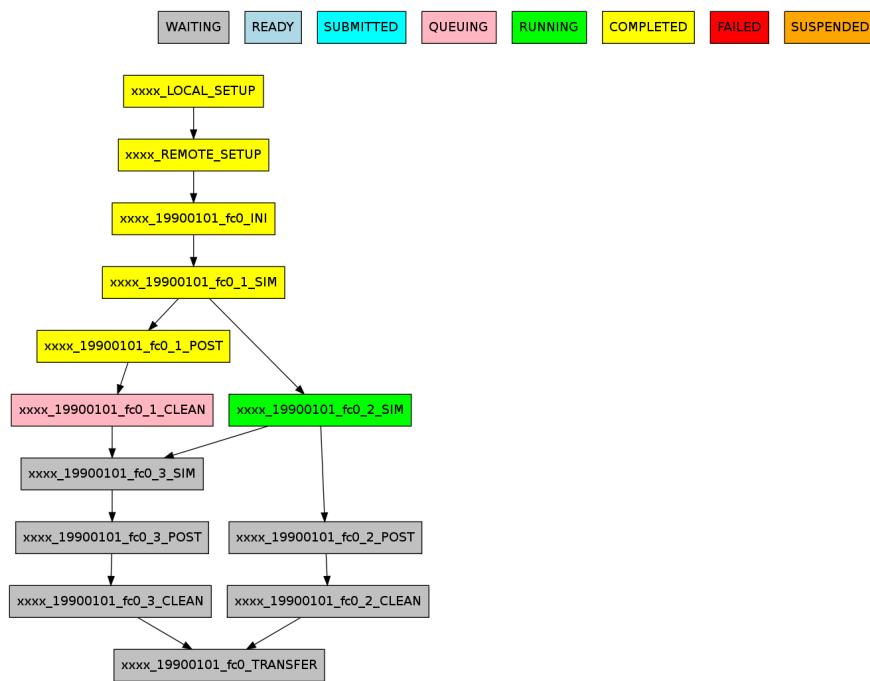

```
autosubmit run xxxx
```

Autosubmit will start submitting jobs to the relevant platforms (both HPC and supporting computers) by using the scripts specified in `jobs_xxxx.conf`. Autosubmit will substitute variables present on scripts where handlers appear in `%variable_name%` format. Autosubmit provides variables for *current chunk*, *start date*, *member*, *computer configuration* and more, and also will replace variables from `proj_xxxx.conf`.

To monitor the status of the experiment, the command:

```
autosubmit monitor xxxx
```

is available. This will plot the workflow of the experiment and the current status.

2.3: Example of monitoring plot for EC-Earth run with Autosubmit for 1 start date, 1 member and 3 chunks.

# CHAPTER 3

---

## Tutorial start guide

---

This tutorial is a starter's guide to running a dummy experiment with Autosubmit.

Dummy experiments run workflows with non-expensive empty tasks and therefore are ideal for teaching and testing purposes.

Real experiments instead run workflows with complex tasks. To read information about how to develop parameterizable tasks for Autosubmit workflows, refer to [Developing a project](#).

### 3.1 Pre-requisites

Autosubmit needs to establish **password-less SSH connections** in order to run and monitor workflows on remote platforms.

Ensure that you have a **password-less** connection to all platforms you want to use in your experiment. If you are unsure how to do this, please follow these instructions:

- Open a terminal and prompt `ssh-keygen -t rsa -b 4096 -C "email@email.com" -m PEM`
- Copy the resulting key to your platform of choice. Via SCP or ssh-copy-key.

## 3.2 Description of most used commands

Command	Short description
<b>expid</b>	Creates a new experiment and generates a new entry in the database by giving it a serial id composed of 4 letters. In addition, it also creates the folder experiment and the basic folder structure.
<b>create &lt;expid&gt;</b>	Generates the experiment workflow.
<b>run &lt;expid&gt;</b>	Runs the experiment workflow.
<b>monitor &lt;expid&gt;</b>	Shows the experiment workflow structure and status.
<b>inspect &lt;expid&gt;</b>	Generates Autosubmit scripts and batch scripts for inspection, by processing the tasks' templates with the experiment parameters.
<b>refresh &lt;expid&gt;</b>	Updates the project directory.
<b>recover &lt;expid&gt;</b>	Recover the experiment workflow obtaining the last run complete jobs.
<b>setstatus &lt;expid&gt;</b>	Sets one or multiple jobs status to a given value.

## 3.3 Create a new experiment

```
autosubmit expid -dm -H "local" -d "Tutorial"
```

- *-dm: Generates a dummy experiment.*
- *-H: Sets the principal experiment platform.*
- *-d: Sets a short description for the experiment.*

The output of the command will show the expid of the experiment and generate the following directory structure:

Experiment folder	Contains
conf	Experiment configuration files.
pkl	Workflow pkl files.
plot	Visualization output files
tmp	Logs, templates and misc files.
proj	User scripts and project code. (empty)

Then, prompt `autosubmit create <expid> -np` and Autosubmit will generate the workflow graph.

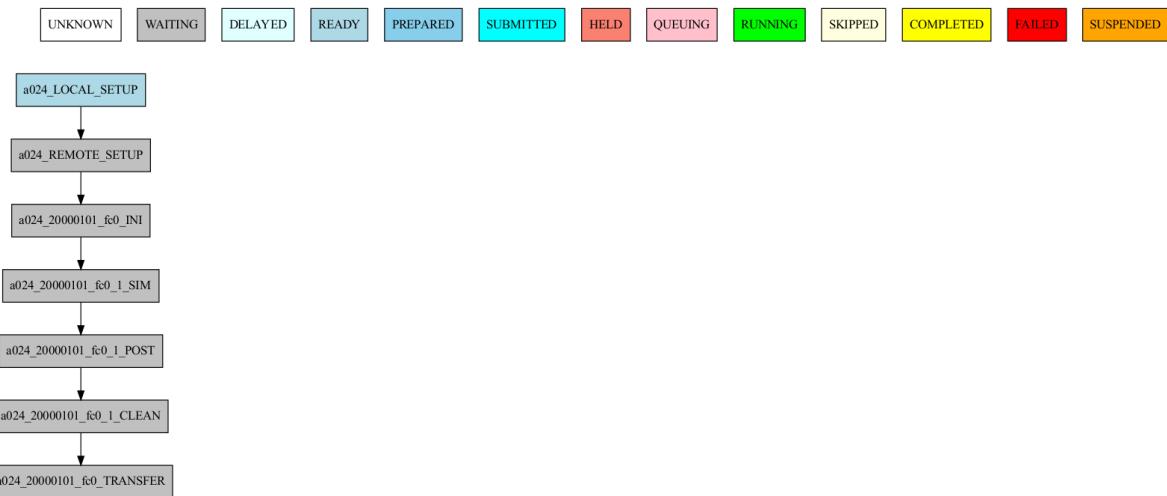

## 3.4 Run and monitoring:

To run an experiment, use `autosubmit run <expid>`. Autosubmit run experiments performing the following operations:

- First, it **checks the experiment configuration**. If it is wrong, it won't proceed further.
- Second, it **runs the experiment while retrieving all logs** from completed or failed tasks as they run.
- Third, it manages all the **workflow steps by following the dependencies defined by the user** until all jobs are in COMPLETED or FAILED status. There can be jobs left in WAITING status if their dependencies are in FAILED status.

While the experiment is running, it can be visualized via `autosubmit monitor <expid>`.

illustrates the output of the autosubmit monitor. It describes all workflow jobs' possible status and actual status.

At the same time, the `<expid>/tmp` gets filled with the cmd scripts generated by Autosubmit to run the local and remote tasks (in this case, they are sent and submitted to the remote platform(s)).

On the other hand, the ASLOGS and LOG\_a000 folders are filling up with AS command logs and jobs logs.

### 3.5 Configuration summary:

In the folder `<expid>/conf` there are different files that define the actual experiment configuration.

File	Content
expdef.conf	<ul style="list-style-type: none"> <li>• It contains the default platform, the one set with -H.</li> <li>• Allows changing the start dates, members and chunks.</li> <li>• Allows changing the experiment project source ( git, local, svn or dummy)</li> </ul>
platforms.conf	<ul style="list-style-type: none"> <li>• It contains the list of platforms to use in the experiment.</li> <li>• This file contains the definitions for managing clusters, fat-nodes and support computers.</li> <li>• This file must be filled-up with the platform(s) configuration(s).</li> <li>• Several platforms can be defined and used in the same experiment.</li> </ul>
jobs.conf	<ul style="list-style-type: none"> <li>• It contains the tasks' definitions in sections. Depending on the parameters, one section can generate multiple similar tasks.</li> <li>• This file must be filled-up with the tasks' definitions.</li> <li>• Several sections can be defined and used in the same experiment.</li> </ul>
autosubmit.conf	<ul style="list-style-type: none"> <li>• This file contains the definitions that impact the workflow behavior.</li> <li>• It changes workflow behavior with parameters such as job limitations, remote_dependendies and retrials.</li> <li>• It extends autosubmit functionalities with parameters such as wrappers and mail notification.</li> </ul>
proj.conf	<ul style="list-style-type: none"> <li>• This file contains the configuration used by the user scripts.</li> <li>• This file is fully customizable for the current experiment. Allows setting user-parameters that will be readable by the autosubmit jobs.</li> </ul>

## 3.6 Final step: Modify and run

It is time to look into the configuration files of the dummy experiment and modify them with a remote platform to run a workflow with a few more chunks.

Open expdef.conf

```
[DEFAULT]
EXPID = a000 #<- don't change
HPCARCH = local # Change for your new main platform name, ej. marenostrum4

# Locate and change these parameters, per ej. numchunks = 3
[experiment]
DATELIST = 20000101
MEMBERS = fc0
NUMCHUNKS = 1
(...)
```

Now open platforms.conf. Note: This will be an example for marenostrum4

```
[marenostrum4]
# Queue type. Options: ps, SGE, LSF, SLURM, PBS, eceaccess
```

(continues on next page)

(continued from previous page)

```
TYPE = slurm # scheduler type
HOST = mn1.bsc.es,mn2.bsc.es,mn3.bsc.es
PROJECT = bsc32 # <- your project
USER = bsc32070 # <- your user
SCRATCH_DIR = /gpfs/scratch
ADD_PROJECT_TO_HOST = False
# use 72:00 if you are using a PRACE account, 48:00 for the bsc account
MAX_WALLCLOCK = 02:00
# use 19200 if you are using a PRACE account, 2400 for the bsc account
MAX_PROCESSORS = 2400
PROCESSORS_PER_NODE = 48
SERIAL_QUEUE = debug
QUEUE = debug
```

autosubmit create <expid>\*\* (without -np) will generate the new workflow and autosubmit run <expid> will run the experiment with the latest changes.

# CHAPTER 4

## Developing a project

This section contains some examples on how to develop a new project.

All files, with the exception of user-defined scripts, are located in the <expid>/conf directory.

Configuration files are written in ini format. In the other hand, the user-defined scripts are written in bash/python or R format.

To configure the experiment, edit `autosubmit_cxxx.conf`, `expdef_cxxx.conf`, `jobs_cxxx.conf`, `platforms_cxxx.conf` and `proj_cxxx.conf`` in the conf folder of the experiment.

### 4.1 Expdef configuration

```
vi <experiments_directory>/cxxx/conf/expdef_cxxx.conf
```

```
[DEFAULT]
# Experiment identifier
# No need to change
EXPID = cxxx
# HPC name.
# No need to change
HPCARCH = ithaca

[experiment]
# Supply the list of start dates. Available formats: YYYYMMDD YYYYMMDDhh YYYYMMDDhhmm
# Also you can use an abbreviated syntax for multiple dates with common parts:
# 200001[01 15] <=> 20000101 20000115
# DATELIST = 19600101 19650101 19700101
# DATELIST = 1960[0101 0201 0301]
DATELIST = 19900101
# Supply the list of members. LIST = fc0 fc1 fc2 fc3 fc4
MEMBERS = fc0
# Chunk size unit. STRING = hour, day, month, year
CHUNKSIZEUNIT = month
```

(continues on next page)

(continued from previous page)

```
# Chunk size. NUMERIC = 4, 6, 12
CHUNKSIZE = 1
# Total number of chunks in experiment. NUMERIC = 30, 15, 10
NUMCHUNKS = 2
# Calendar used. LIST: standard, noleap
CALENDAR = standard
# List of members that can be included in this run. Optional.
# RUN_ONLY_MEMBERS = fc0 fc1 fc2 fc3 fc4
# RUN_ONLY_MEMBERS = fc[0-4]
RUN_ONLY_MEMBERS =

[rerun]
# Is a rerun or not? [Default: Do set FALSE]. BOOLEAN = TRUE, FALSE
RERUN = FALSE
# If RERUN = TRUE then supply the list of jobs to rerun
RERUN_JOBLIST =

[project]
# Select project type. STRING = git, svn, local, none
# If PROJECT_TYPE is set to none, Autosubmit self-contained dummy templates will be
# used

# Where is JOBS CONFIGURATION file location relative to project root path
FILE_JOBS_CONF = templates/common/jobs.conf
```

## 4.2 Autosubmit configuration

vi <experiments\_directory>/cxx/cfg/autosubmit\_cxx.conf

```
[config]
# Experiment identifier
# No need to change
EXPID =
# No need to change.
# Autosubmit version identifier
AUTOSUBMIT_VERSION =
# Default maximum number of jobs to be waiting in any platform
# Default = 3
MAXWAITINGJOBS = 3
# Default maximum number of jobs to be running at the same time at any platform
# Can be set at platform level on the platform_cxx.conf file
# Default = 6
TOTALJOBS = 6
# Time (seconds) between connections to the HPC queue scheduler to poll already_
→submitted jobs status
# Default = 10
SAFETYSLEEPSIME = 10
# Number of retrials if a job fails. Can be override at job level
# Default = 0
RETRIALS = 0
## Allows to put a delay between retries, of retrials if a job fails. If not_
→specified, it will be static
# DELAY_RETRY_TIME = 11
# DELAY_RETRY_TIME = +11 # will wait 11,22,33,44...
# DELAY_RETRY_TIME = *11 # will wait 11,110,1110,11110...
# Default output type for CREATE, MONITOR, SET STATUS, RECOVERY. Available options:__
→pdf, svg, png, ps, txt
# Default = pdf
OUTPUT = pdf
# [wrappers]
```

## 4.3 Jobs configuration

vi <experiments\_directory>/cxx/cfg/jobs\_cxx.conf

```
# Example job with all options specified

## Job name
# [JOBNAME]
## Script to execute. If not specified, job will be omitted from workflow.
## Path relative to the project directory
# FILE =
## Platform to execute the job. If not specified, defaults to HPCARCH in expedf file.
## LOCAL is always defined and refers to current machine
# PLATFORM =
## Queue to add the job to. If not specified, uses PLATFORM default.
# QUEUE =
## Defines dependencies from job as a list of parents jobs separated by spaces.
## Dependencies to jobs in previous chunk, member o startdate, use -(DISTANCE)
# DEPENDENCIES = INI SIM-1 CLEAN-2
```

(continues on next page)

(continued from previous page)

```
## Define if jobs runs once, once per stardate, once per member or once per chunk.  
## Options: once, date, member, chunk.  
## If not specified, defaults to once  
# RUNNING = once  
## Specifies that job has only to be run after X dates, members or chunk. A job will  
## always be created for the last  
## If not specified, defaults to 1  
# FREQUENCY = 3  
## On a job with FREQUENCY > 1, if True, the dependencies are evaluated against all  
## jobs in the frequency interval, otherwise only evaluate dependencies against  
## current  
## iteration.  
## If not specified, defaults to True  
# WAIT = False  
## Defines if job is only to be executed in reruns. If not specified, defaults to  
## false.  
# RERUN_ONLY = False  
## Wallclock to be submitted to the HPC queue in format HH:MM  
# WALLCLOCK = 00:05  
  
## Processors number to be submitted to the HPC. If not specified, defaults to 1.  
## Wallclock chunk increase (WALLCLOCK will be increased according to the formula  
## WALLCLOCK + WCHUNKINC * (chunk - 1)).  
## Ideal for sequences of jobs that change their expected running time according to  
## the current chunk.  
# WCHUNKINC = 00:01  
# PROCESSORS = 1  
## Threads number to be submitted to the HPC. If not specified, defaults to 1.  
# THREADS = 1  
## Enables hyper-threading. If not specified, defaults to false.  
# HYPERTHREADING = false  
## Tasks number to be submitted to the HPC. If not specified, defaults to 1.  
# Tasks = 1  
## Memory requirements for the job in MB  
# MEMORY = 4096  
## Number of retrials if a job fails. If not specified, defaults to the value given  
## on experiment's autosubmit.conf  
# RETRIES = 4  
## Allows to put a delay between retries, of retrials if a job fails. If not  
## specified, it will be static  
# DELAY_RETRY_TIME = 11  
# DELAY_RETRY_TIME = +11 # will wait 11,22,33,44...  
# DELAY_RETRY_TIME = *11 # will wait 11,110,1110,11110...  
## Some jobs can not be checked before running previous jobs. Set this option to  
## false if that is the case  
# CHECK = False  
## Select the interpreter that will run the job. Options: bash, python, r Default:  
## bash  
# TYPE = bash  
## Specify the path to the interpreter. If empty, use system default based on job  
## type . Default: empty  
# EXECUTABLE = /my_python_env/python3
```

## 4.4 Platform configuration

vi <experiments\_directory>/cxxx/conf/platforms\_cxxx.conf

```

# Example platform with all options specified

## Platform name
# [PLATFORM]
## Queue type. Options: PBS, SGE, PS, LSF, ecaccess, SLURM
# TYPE =
## Version of queue manager to use. Needed only in PBS (options: 10, 11, 12) and
## ecaccess (options: pbs, loadleveler)
# VERSION =
## Hostname of the HPC
# HOST =
## Project for the machine scheduler

```

(continues on next page)

(continued from previous page)

```
# PROJECT =
## Budget account for the machine scheduler. If omitted, takes the value defined in PROJECT
# BUDGET =
## Option to add project name to host. This is required for some HPCs
# ADD_PROJECT_TO_HOST = False
## User for the machine scheduler
# USER =
## Path to the scratch directory for the machine
# SCRATCH_DIR = /scratch
## If true, autosubmit test command can use this queue as a main queue. Defaults to false
# TEST_SUITE = False
## If given, autosubmit will add jobs to the given queue
# QUEUE =
## If specified, autosubmit will run jobs with only one processor in the specified platform.
# SERIAL_PLATFORM = SERIAL_PLATFORM_NAME
## If specified, autosubmit will run jobs with only one processor in the specified queue.
## Autosubmit will ignore this configuration if SERIAL_PLATFORM is provided
# SERIAL_QUEUE = SERIAL_QUEUE_NAME
## Default number of processors per node to be used in jobs
# PROCESSORS_PER_NODE =
## Default Maximum number of jobs to be waiting in any platform queue
## Default = 3
# MAX_WAITING_JOBS = 3
## Default maximum number of jobs to be running at the same time at the platform.
## Applies at platform level. Considers QUEUING + RUNNING jobs.
## Ideal for configurations where some remote platform has a low upper limit of allowed jobs per user at the same time.
## Default = 6
# TOTAL_JOBS = 6

[ithaca]
# Queue type. Options: ps, SGE, LSF, SLURM, PBS, eceaccess
TYPE = SGE
HOST = ithaca
PROJECT = cfu
ADD_PROJECT_TO_HOST = true
USER = dbeltran
SCRATCH_DIR = /scratch/cfu
TEST_SUITE = True
```

## 4.5 Proj configuration

After filling the experiment configuration and prompt `autosubmit create cxxx -np create`, user can go into `proj` which has a copy of the model.

The experiment project contains the scripts specified in `jobs_cxxx.conf` and a copy of model source code and data specified in `expdef_xxxx.conf`.

To configure experiment project parameters for the experiment, edit `proj_cxxx.conf`.

`proj_cxxx.conf` contains:

- The project dependant experiment variables that Autosubmit will substitute in the scripts to be run.

**Warning:** The proj\_xxxx.conf has to be defined in INI style so it should have section headers. At least one.

Example:

```
vi <experiments_directory>/cxxxx/conf/proj_cxxx.conf
```

```
[common]
# No need to change.
MODEL = ecearth
# No need to change.
VERSION = v3.1
# No need to change.
TEMPLATE_NAME = ecearth3
# Select the model output control class. STRING = Option
# listed under the section : https://earth.bsc.es/wiki/doku.php?id=overview_outclasses

## 4.5.1 Proj configuration:: Full example

This section contains a full example of a valid proj file with a valid user script.

Configuration of proj.conf

```
vi <expid>/conf/proj_cxxx.conf
```

```
PROJECT_ROOT = /gpfs/scratch/bsc32/bsc32070/a000/automatic_perfomance_profile
REFRESH_GIT_REPO = false
```

Write your original script in the user project directory:

```
vi <expid>/proj/template/autosubmit/remote_setup.sh
```

```
cd %CURRENT_ROOTDIR% # This comes from autosubmit.
# Clone repository to the remote for needed files
# if exist or force refresh is true
if [ ! -d %PROJECT_ROOT% ] || [ %REFRESH_GIT_REPO% == true ];
then
    chmod +w -R %PROJECT_ROOT% ||
    rm -rf %PROJECT_ROOT% ||
    git clone (...)

fi
(...)
```

Final script, which is generated by *autosubmit run* or *autosubmit inspect*

```
cat <experiments_directory>/cxx/tmpp/remote_setup.cmd
```

```
cd /gpfs/scratch/bsc32/bsc32070/a000
# Clone repository to the remote for needed files
# if exist or force refresh is true
if [ ! -d /gpfs/scratch/bsc32/bsc32070/a000/automatic_performance_profile ] || [ ↴false == true ];
then
    chmod +w -R /gpfs/scratch/bsc32/bsc32070/a000/automatic_performance_profile ||
    rm -rf /gpfs/scratch/bsc32/bsc32070/a000/automatic_performance_profile ||
    git clone (...)

```

## 4.5.2 Detailed platform configuration

In this section, we describe the platform configuration using *-QOS* and also *PARTITION*

```
vi <expid>/conf/platform_cxxx.conf
```

```
[marenostrum0]
TYPE = ps
HOST = mn0.bsc.es
PROJECT = bsc32
USER = bsc32070
ADD_PROJECT_TO_HOST = false
SCRATCH_DIR = /gpfs/scratch

[marenostrum4]
# Queue type. Options: ps, SGE, LSF, SLURM, PBS, eceaccess
TYPE = slurm
HOST = mn1.bsc.es,mn2.bsc.es,mn3.bsc.es
PROJECT = bsc32
USER = bsc32070
SCRATCH_DIR = /gpfs/scratch
ADD_PROJECT_TO_HOST = False
# use 72:00 if you are using a PRACE account, 48:00 for the bsc account
```

(continues on next page)

(continued from previous page)

```
MAX_WALLCLOCK = 02:00
# use 19200 if you are using a PRACE account, 2400 for the bsc account
MAX_PROCESSORS = 2400
PROCESSORS_PER_NODE = 48
#SERIAL_QUEUE = debug
#QUEUE = debug
CUSTOM_DIRECTIVES = ["#SBATCH -p small", "#SBATCH --no-requeue", "#SBATCH --usage"]

[marenostrum_archive]
TYPE = ps
HOST = dt02.bsc.es
PROJECT = bsc32
USER = bsc32070
SCRATCH_DIR = /gpfs/scratch
ADD_PROJECT_TO_HOST = False
TEST_SUITE = False

[power9]
TYPE = slurm
HOST = plogin1.bsc.es
PROJECT = bsc32
USER = bsc32070
SCRATCH_DIR = /gpfs/scratch
ADD_PROJECT_TO_HOST = False
TEST_SUITE = False
SERIAL_QUEUE = debug
QUEUE = debug

[nord3]
TYPE = lsf
HOST = nord1.bsc.es
PROJECT = bsc32
USER = bsc32070
ADD_PROJECT_TO_HOST = False
SCRATCH_DIR = /gpfs/scratch
TEST_SUITE = False
MAX_WALLCLOCK = 48:00
MAX_PROCESSORS = 1024
PROCESSORS_PER_NODE = 16

[transfer_node]

(continues on next page)

(continued from previous page)

```
[bscearth000]
TYPE = ps
HOST = bscearth000
PROJECT = Earth
USER = dbeltran
SCRATCH_DIR = /esarchive/scratch
```

**Warning:** The TYPE field is mandatory. The HOST field is mandatory. The PROJECT field is mandatory. The USER field is mandatory. The SCRATCH\_DIR field is mandatory. The ADD\_PROJECT\_TO\_HOST field is mandatory.

**Warning:** The TEST\_SUITE field is optional. The MAX\_WALLCLOCK field is optional. The MAX\_PROCESSORS field is optional. The PROCESSORS\_PER\_NODE field is optional.

**Warning:** The SERIAL\_QUEUE and QUEUE field are used for specify a -QOS. For specify a partition, you must use CUSTOM\_DIRECTIVES. For specify the memory usage you must use MEMORY but only in jobs.conf.

The custom directives can be used for multiple parameters at the same time using the follow syntax.

```
vi <expid>/conf/platform_cxxx.conf
```

```
[puhti]
#Check your partition ( test/small/large)
CUSTOM_DIRECTIVES = ["#SBATCH -p test", "#SBATCH --no-requeue", "#SBATCH --usage"]
### Batch job system / queue at HPC
TYPE = slurm
### Hostname of the HPC
HOST = puhti
### Project name-ID at HPC (WEATHER)
PROJECT = project_test
### User name at HPC
USER = dbeltran
### Path to the scratch directory for the project at HPC
SCRATCH_DIR = /scratch
# Should've false already, just in case it is not
ADD_PROJECT_TO_HOST = False

#Check your partition ( test[00:15]/small[72:00]/large[72:00] ) max_wallclock
MAX_WALLCLOCK = 00:15
# [test [80] // small [40] // large [1040]
MAX_PROCESSORS = 80
# test [40] / small [40] // large [40]
PROCESSORS_PER_NODE = 40
```

# CHAPTER 5

---

## Installation

---

### 5.1 How to install

The Autosubmit code is maintained in *PyPi*, the main source for python packages.

- Pre-requisites: bash, python2, sqlite3, git-scm > 1.8.2, subversion, dialog, curl, python-tk(tkinter in centOS), python2-dev, graphviz >= 2.41, pip2

---

**Important:** (SYSTEM) Graphviz version must be >= 2.38 except 2.40(not working). You can check the version using dot -v.

---

- Python dependencies: argparse, python-dateutil, pyparsing, numpy, pydotplus, matplotlib, paramiko, python2-pythondialog, portalocker, requests, typing, six >= 1.10

---

**Important:** dot -v command should contain “dot”,pdf,png,svg,xlib in device section.

---

---

**Important:** The host machine has to be able to access HPC’s/Clusters via password-less ssh. Make sure that the ssh key is in PEM format *ssh-keygen -t rsa -b 4096 -C “email@email.com” -m PEM*.

---

To install autosubmit just execute:

```
pip install autosubmit
```

or download, unpack and:

```
python setup.py install
```

---

**Hint:** To check if autosubmit has been installed run *autosubmit -v*. This command will print autosubmit’s

---

current version

---

**Hint:** To read autosubmit's readme file, run `autosubmit readme`

---

**Hint:** To see the changelog, use `autosubmit changelog`

---

## 5.2 How to configure

After installation, you have to configure database and path for Autosubmit. In order to use the default settings, just create a directory called `autosubmit` in your home directory before running the `configure` command. The experiments will be created in this folder, and the database named `autosubmit.db` in your home directory.

```
autosubmit configure
```

For advanced options you can add `--advanced` to the `configure` command. It will allow you to choose different directories (they must exist) for the experiments and database, as well as configure SMTP server and an email account in order to use the email notifications feature.

```
autosubmit configure --advanced
```

**Hint:** The dialog (GUI) library is optional. Otherwise the configuration parameters will be prompted (CLI). Use `autosubmit configure -h` to see all the allowed options.

---

For installing the database for Autosubmit on the configured folder, when no database is created on the given path, execute:

```
autosubmit install
```

**Danger:** Be careful ! `autosubmit install` will create a blank database.

Lastly, if `autosubmit configure` doesn't work for you or you need to configure additional info create:

Create or modify `/etc/autosubmitrc` file or `~/.autosubmitrc` with the information as follows:

```
[database]
path = path to autosubmit db
filename = autosubmit.db

[local]
path = path to experiment folders

[conf]
jobs = path to any experiment jobs conf # If not working on esarchive, you must ↵
      create one from scratch check the how to.
platforms = path to any experiment platform conf # If not working on esarchive, you ↵
            must create one from scratch check the how to.
```

(continues on next page)

(continued from previous page)

```

[mail]
smtp_server = mail.bsc.es
mail_from = automail@bsc.es

[structures]
path = path to experiment folders

[globallogs]
path = path to global logs (for expid,delete and migrate commands)

[historicdb]
path = <experiment_folder>/historic

[autosubmitapi]
url = url of Autosubmit API (The API is provided inside the BSC network)
# Autosubmit API provides extra information for some Autosubmit functions. It is not
# mandatory to have access to it to use Autosubmit.

[hosts]
authorized = [run bscearth000,bscesautosubmit01,bscesautosubmit02] [stats,clean,
# describe,check,report,dbfix,pklfix,updatedescript,updateversion all]
forbidden = [expid,create,recovery,delete,inspect,monitor,recovery,migrate,configure,
# setstatus,testcase,test,refresh,archive,unarchive bscearth000,bscesautosubmit01,
# bscesautosubmit02]

```

Hosts: From 3.14+ onwards, autosubmit commands can be tailored to run on specific machines. Previously, only run was affected by the deprecated whitelist parameter.

- authorized: [<command1,commandN> <machine1,machineN>] list of machines that can run given autosubmit commands.
- forbidden: [<command1,commandN> <machine1,machineN>] list of machines that cannot run given autosubmit commands.
- If no commands are defined, all commands are authorized.
- If no machines are defined, all machines are authorized.

Now you are ready to use Autosubmit !

## 5.3 Examples

### 5.3.1 Sequence of instructions to install Autosubmit and its dependencies in Ubuntu.

```

# Update repositories
apt update

# Avoid interactive stuff
export DEBIAN_FRONTEND=noninteractive

# Dependencies
apt install wget curl python2 python-tk python2-dev graphviz -y -q

# Additional dependencies related with pycrypto

```

(continues on next page)

(continued from previous page)

```
apt install build-essential libssl-dev libffi-dev -y -q

# Download get pip script and launch it
wget https://bootstrap.pypa.io/pip/2.7/get-pip.py
python2 get-pip.py

# Install autosubmit using pip
pip2 install autosubmit

# Check that we can execute autosubmit commands
autosubmit -h

# Configure
autosubmit configure

# Install
autosubmit install

# Get expid
autosubmit expid -H TEST -d "Test exp."

# Create with -np
# Since it was a new install the expid will be a000
autosubmit create a000 -np
```

### 5.3.2 Sequence of instructions to install Autosubmit and its dependencies with conda.

```
# Download conda
wget https://repo.anaconda.com/miniconda/Miniconda3-py39_4.12.0-Linux-x86_64.sh
# Launch it
chmod +x ./Miniconda3-py39_4.12.0-Linux-x86_64.sh ; ./Miniconda3-py39_4.12.0-Linux-
→x86_64.sh
# Download git
apt install git -y -q
# Download autosubmit
git clone https://earth.bsc.es/gitlab/es/autosubmit.git -b v3.14.0
cd autosubmit
# Create conda environment
conda env update -f environment.yml -n autosubmit python=2
# Activate env
source activate autosubmit
# Test autosubmit
autosubmit -v
# Configure autosubmitrc and install database as indicated in this doc
```

# CHAPTER 6

---

## Usage

---

### 6.1 Command list

<b>-expid</b>	Create a new experiment
<b>-create</b>	Create specified experiment workflow
<b>-check</b>	Check configuration for specified experiment
<b>-describe</b>	Show details for specified experiment
<b>-run</b>	Run specified experiment
<b>-inspect</b>	Generate cmd files
<b>-test</b>	Test experiment
<b>-testcase</b>	Test case experiment
<b>-monitor</b>	Plot specified experiment
<b>-stats</b>	Plot statistics for specified experiment
<b>-setstatus</b>	Sets job status for an experiment
<b>-recovery</b>	Recover specified experiment
<b>-clean</b>	Clean specified experiment
<b>-refresh</b>	Refresh project directory for an experiment
<b>-delete</b>	Delete specified experiment
<b>-configure</b>	Configure database and path for autosubmit
<b>-install</b>	Install database for Autosubmit on the configured folder
<b>-archive</b>	Clean, compress and remove from the experiments' folder a finalized experiment
<b>-unarchive</b>	Restores an archived experiment
<b>-migrate_exp</b>	Migrates an experiment from one user to another

<b>-report</b>	extract experiment parameters
<b>-updateversion</b>	Updates the Autosubmit version of your experiment with the current version of the module you are using
<b>-dbfix</b>	Fixes the database malformed error in the historical database of your experiment
<b>-pkifix</b>	Fixed the blank pkl error of your experiment
<b>-updatedescrip</b>	Updates the description of your experiment (See: updateDescrip)

## 6.2 Tutorials (How to)

- new\_experiment
- configuration
- run\_modes
- workflow\_recovery
- workflow\_validation
- stats
- archive
- advanced\_features

# CHAPTER 7

---

## Defining the workflow

---

One of the most important step that you have to do when planning to use autosubmit for an experiment is the definition of the workflow the experiment will use. In this section you will learn about the workflow definition syntax so you will be able to exploit autosubmit's full potential

**Warning:** This section is NOT intended to show how to define your jobs. Please go to *Tutorial start guide* section for a comprehensive list of job options.

### 7.1 Simple workflow

The simplest workflow that can be defined it is a sequence of two jobs, with the second one triggering at the end of the first. To define it, we define the two jobs and then add a DEPENDENCIES attribute on the second job referring to the first one.

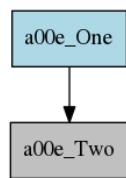

It is important to remember when defining workflows that DEPENDENCIES on autosubmit always refer to jobs that should be finished before launching the job that has the DEPENDENCIES attribute.

```
JOBs:  
  One:  
    FILE: "one.sh"  
  Two:  
    FILE: "two.sh"  
    DEPENDENCIES: "One"
```

The resulting workflow can be seen in Figure 7.1

### 7.2 Running jobs once per startdate, member or chunk

Autosubmit is capable of running ensembles made of various startdates and members. It also has the capability to divide member execution on different chunks.

7.1: Example showing a simple workflow with two sequential jobs

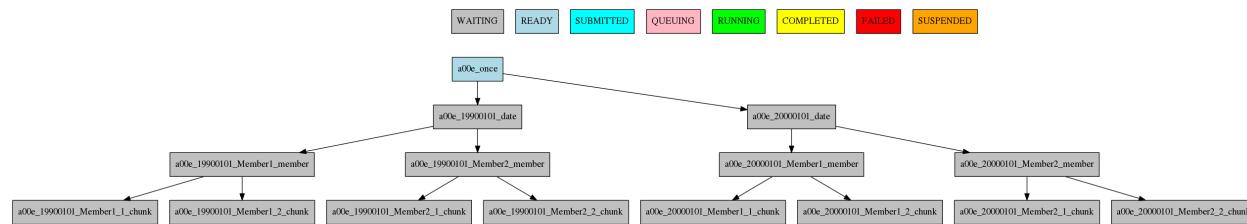

To set at what level a job has to run you have to use the RUNNING attribute. It has four possible values: once, date, member and chunk corresponding to running once, once per startdate, once per member or once per chunk respectively.

```

JOBS:
once:
    FILE: "Once.sh"
date:
    FILE: "date.sh"
    DEPENDENCIES: "once"
    RUNNING: "date"
member:
    FILE: "Member.sh"
    DEPENDENCIES: "date"
    RUNNING: "member"
chunk:
    FILE: "Chunk.sh"
    DEPENDENCIES: "member"
    RUNNING: "chunk"

```

The resulting workflow can be seen in Figure 7.2 for a experiment with 2 startdates, 2 members and 2 chunks.

7.2: Example showing how to run jobs once per startdate, member or chunk.

## 7.3 Dependencies

Dependencies on autosubmit were introduced on the first example, but in this section you will learn about some special cases that will be very useful on your workflows.

### 7.3.1 Dependencies with previous jobs

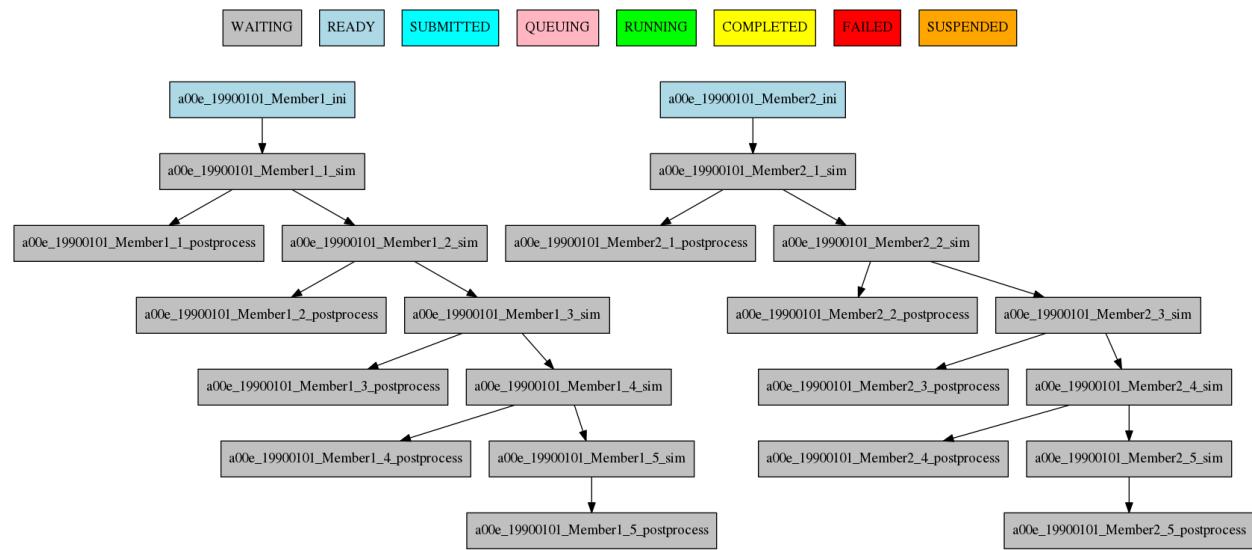

Autosubmit can manage dependencies between jobs that are part of different chunks, members or startdates. The next example will show how to make a simulation job wait for the previous chunk of the simulation. To do that, we add

sim-1 on the DEPENDENCIES attribute. As you can see, you can add as much dependencies as you like separated by spaces

```
JOBS:
  ini:
    FILE: "ini.sh"
    RUNNING: "member"
  sim:
    FILE: "sim.sh"
    DEPENDENCIES: "ini sim-1"
    RUNNING: "chunk"
  postprocess:
    FILE: "postprocess.sh"
    DEPENDENCIES: "sim"
    RUNNING: "chunk"
```

The resulting workflow can be seen in Figure 7.3

**Warning:** Autosubmit simplifies the dependencies, so the final graph usually does not show all the lines that you may expect to see. In this example you can see that there are no lines between the ini and the sim jobs for chunks 2 to 5 because that dependency is redundant with the one on the previous sim

7.3: Example showing dependencies between sim jobs on different chunks.

### 7.3.2 Dependencies between running levels

On the previous examples we have seen that when a job depends on a job on a higher level (a running chunk job depending on a member running job) all jobs wait for the higher running level job to be finished. That is the case on the ini sim dependency on the next example.

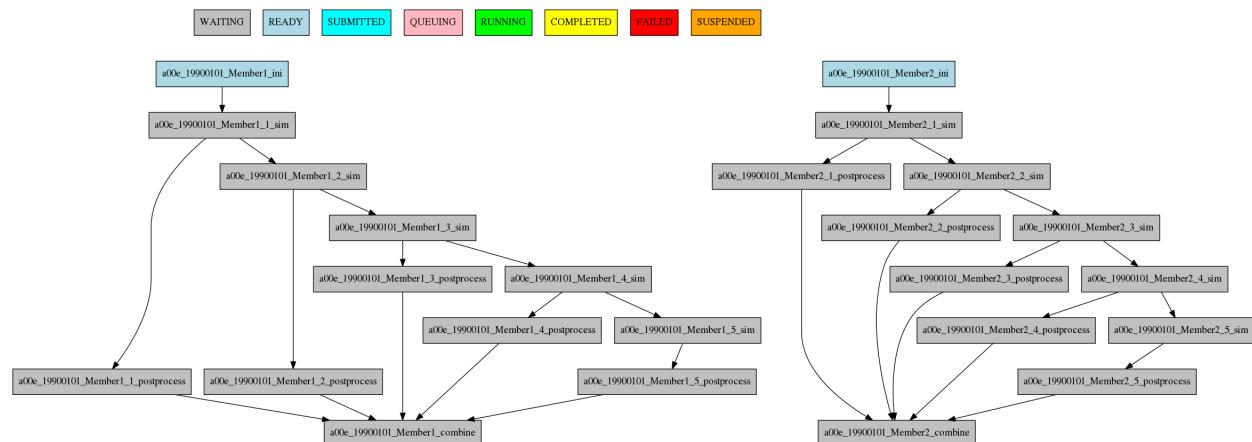

In the other case, a job depending on a lower running level job, the higher level job will wait for ALL the lower level jobs to be finished. That is the case of the postprocess combine dependency on the next example.

```

JOBS:
  ini:
    FILE: "ini.sh"
    RUNNING: "member"
  sim:
    FILE: "sim.sh"
    DEPENDENCIES: "ini sim-1"
    RUNNING: "chunk"
  postprocess:
    FILE: "postprocess.sh"
    DEPENDENCIES: "sim"
    RUNNING: "chunk"
  combine:
    FILE: "combine.sh"
    DEPENDENCIES: "postprocess"
    RUNNING: "member"

```

The resulting workflow can be seen in Figure Section 7.3

7.4: Example showing dependencies between jobs running at different levels.

## 7.4 Job frequency

Some times you just don't need a job to be run on every chunk or member. For example, you may want to launch the postprocessing job after various chunks have completed. This behaviour can be achieved using the FREQUENCY attribute. You can specify an integer I for this attribute and the job will run only once for each I iterations on the running level.

**Hint:** You don't need to adjust the frequency to be a divisor of the total jobs. A job will always execute at the last iteration of its running level

```

JOBS:
  ini:
    FILE: "ini.sh"
    RUNNING: "member"
  sim:

```

(continues on next page)

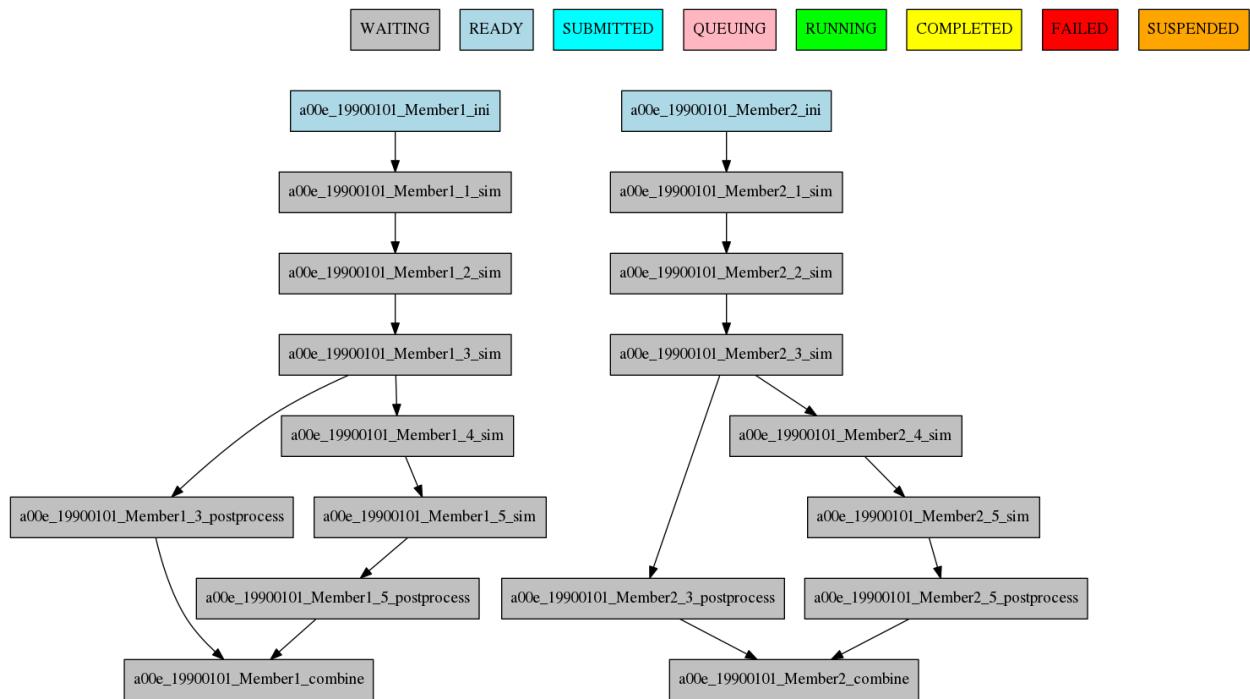

(continued from previous page)

```

FILE: "sim.sh"
DEPENDENCIES: "ini sim-1"
RUNNING: "chunk"
postprocess:
  FILE: "postprocess.sh"
  DEPENDENCIES: "sim"
  RUNNING: "chunk"
  FREQUENCY: "3"
combine:
  FILE: "combine.sh"
  DEPENDENCIES: "postprocess"
  RUNNING: "member"

```

The resulting workflow can be seen in Figure 7.5

7.5: Example showing dependencies between jobs running at different frequencies.

## 7.5 Job synchronize

For jobs running at chunk level, and this job has dependencies, you could want not to run a job for each experiment chunk, but to run once for all member/date dependencies, maintaining the chunk granularity. In this cases you can use the SYNCHRONIZE job parameter to determine which kind of synchronization do you want. See the below examples with and without this parameter.

---

**Hint:** This job parameter works with jobs with RUNNING parameter equals to ‘chunk’.

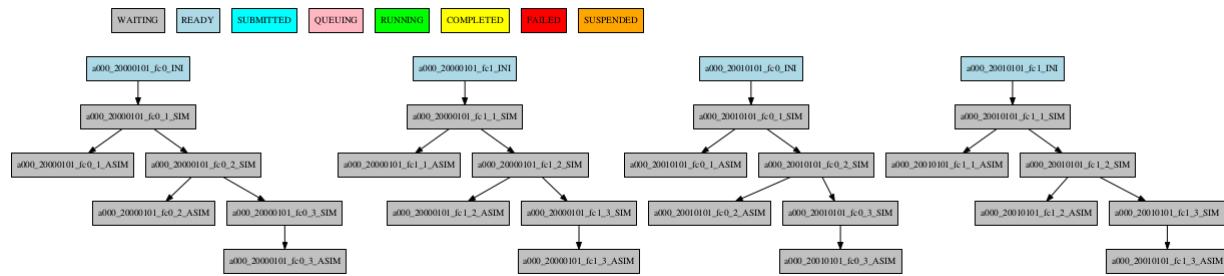

---

```

JOBS:
ini:
  FILE: "ini.sh"
  RUNNING: "member"
sim:
  FILE: "sim.sh"
  DEPENDENCIES: "INI SIM-1"
  RUNNING: "chunk"
ASIM:
  FILE: "asim.sh"
  DEPENDENCIES: "SIM"
  RUNNING: "chunk"

```

The resulting workflow can be seen in Figure 7.6

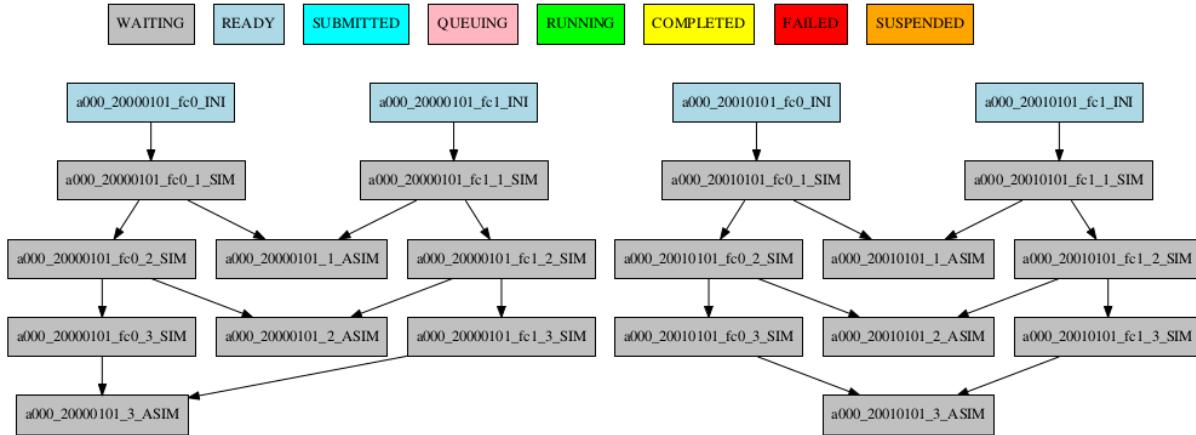

7.6: Example showing dependencies between chunk jobs running without synchronize.

```

JOBS:
ASIM:
  SYNCHRONIZE: member

```

The resulting workflow of setting SYNCHRONIZE parameter to ‘member’ can be seen in Figure 7.7

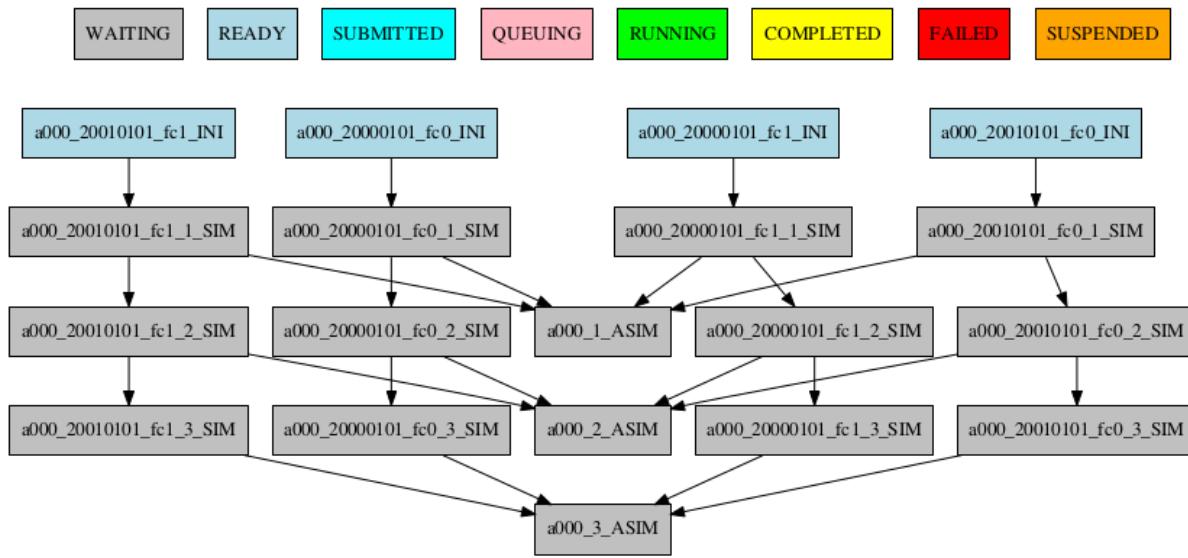

7.7: Example showing dependencies between chunk jobs running with member synchronize.

```

JOBS:
ASIM:
  SYNCHRONIZE: member

```

The resulting workflow of setting SYNCHRONIZE parameter to ‘date’ can be seen in Figure 7.8

7.8: Example showing dependencies between chunk jobs running with date synchronize.

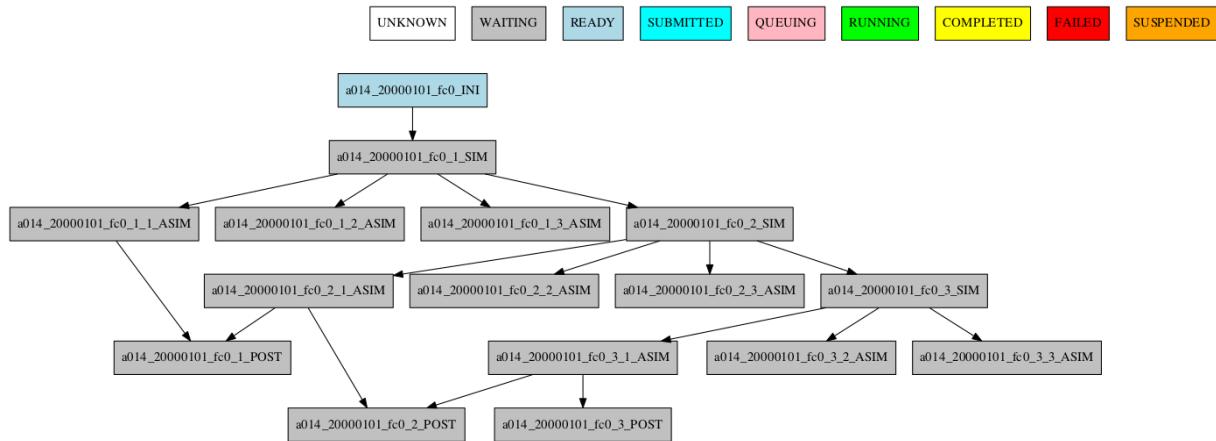

## 7.6 Job split

For jobs running at chunk level, it may be useful to split each chunk into different parts. This behaviour can be achieved using the SPLITS attribute to specify the number of parts. It is possible to define dependencies to specific splits within [], as well as to a list/range of splits, in the format [1:3,7,10] or [1,2,3]

**Hint:** This job parameter works with jobs with RUNNING parameter equals to ‘chunk’.

```
JOBS:
  ini:
    FILE: "ini.sh"
    RUNNING: "member"
  sim:
    FILE: "sim.sh"
    DEPENDENCIES: "ini sim-1"
    RUNNING: "chunk"
  asim:
    FILE: "asim.sh"
    DEPENDENCIES: "sim"
    RUNNING: "chunk"
    SPLITS: "3"
  post:
    FILE: "post.sh"
    RUNNING: "chunk"
    DEPENDENCIES: "asim[1] asim[1]+1"
```

The resulting workflow can be seen in Figure 7.9

7.9: Example showing the job ASIM divided into 3 parts for each chunk.

## 7.7 Job delay

Some times you need a job to be run after a certain number of chunks. For example, you may want to launch the asim job after various chunks have completed. This behaviour can be achieved using the `DELAY` attribute. You can specify an integer N for this attribute and the job will run only after N chunks.

---

**Hint:** This job parameter works with jobs with `RUNNING` parameter equals to ‘chunk’.

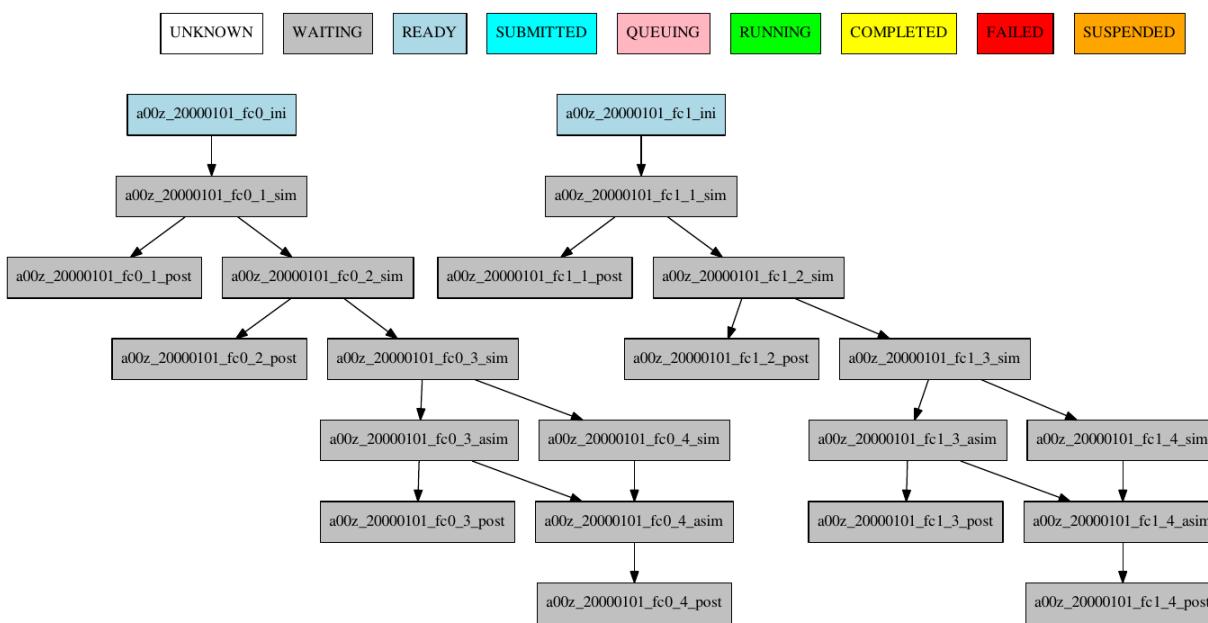

---

```

JOBS:
  ini:
    FILE: "ini.sh"
    RUNNING: "member"
  sim:
    FILE: "sim.sh"
    DEPENDENCIES: "ini sim-1"
    RUNNING: "chunk"
  asim:
    FILE: "asim.sh"
    DEPENDENCIES: "sim asim-1"
    RUNNING: "chunk"
    DELAY: "2"
  post:
    FILE: "post.sh"
    DEPENDENCIES: "sim asim"
    RUNNING: "chunk"

```

The resulting workflow can be seen in Figure 7.10

7.10: Example showing the asim job starting only from chunk 3.

# CHAPTER 8

---

## Frequent Questions and Answers

---

The latest version of **Autosubmit** implements a code system that guides you through the process of fixing some of the common problems you might find. Consequently, the **FAQ** section has been replaced by *Error codes and solutions*, where you will find the list of error codes, their descriptions, and solutions.

# CHAPTER 9

---

## Troubleshooting

---

### 9.1 How to change the job status stopping autosubmit

Review setstatus.

### 9.2 How to change the job status without stopping autosubmit

Review setstatusno.

### 9.3 My project parameters are not being substituted in the templates

*Explanation:* If there is a duplicated section or option in any other side of autosubmit, including proj files It won't be able to recognize which option pertains to what section in which file.

*Solution:* Don't repeat section names and parameters names until Autosubmit 4.0 release.

### 9.4 Unable to recover remote logs files.

*Explanation:* If there are limitations on the remote platform regarding multiple connections, *Solution:* You can try DISABLE\_RECOVERY\_THREADS = TRUE under the [platform\_name] section in the platform.conf.

### 9.5 Error on create caused by a configuration parsing error

When running create you can come across an error similar to:

```
[ERROR] Trace: '%' must be followed by '%' or '(', found: u'%HPCROOTDIR%/remoteconfig/  
→%CURRENT_ARCH%_launcher.sh'
```

The important part of this error is the message '%' must be followed by '%' or '('. It indicated that the source of the error is the configparser library. This library is included in the python common libraries, so you shouldn't have any other version of it installed in your environment. Execute pip list, if you see configparser in the list, then run pip uninstall configparser. Then, try to create your experiment again.

## 9.6 Other possible errors

### I see the ‘database malformed‘ error on my experiment log.

*Explanation:* The latest version of autosubmit uses a database to efficiently track changes in the jobs of your experiment. It might happen that this small database gets corrupted.

*Solution:* run *autosubmit dbfix expid* where *expid* is the identifier of your experiment. This function will rebuild the database saving as much information as possible (usually all of it).

### The pkl file of my experiment is empty but there is a job\_list\_%expid%\_backup.pkl file that seems to be the real one.

*Solution:* run *autosubmit pkifix expid*, it will restore the *backup* file if possible.

# CHAPTER 10

---

## Error codes and solutions

---

### 10.1 Experiment Locked - Critical Error 7000

Code   Details   Solution		
7000	Experiment is locked due another instance of Autosubmit using it	Halt other experiment instances //Delete <expid>/tmp/autosubmit.lock

### 10.2 Database Issues - Critical Error codes [7001-7005]

Code   Details   Solution		
7001	Connection to the db could not be established	Check if database exist
7002	Wrong version	Check system sqlite version
7003	DB doesn't exist	Check if database exist
7004	Can't create a new database	Check your user permissions
7005	AS database is corrupted or locked	Please, open a new issue ASAP. (If you are on BSC environment)

#### 10.2.1 Default Solution

These issues are usually from server side, please, ask first in Autosubmit git if you don't have a custom installation.

---

## 10.3 Wrong User Input - Critical Error codes [7010-7030]

Code	Details	Solution
7010	Experiment has been halted in a manual way	
7011	Wrong arguments for an specific command	Check the command section for more info
7012	Insufficient permissions for an specific experiment.	Check if you have enough permissions, experiment exist or specified expid has a typo
7013	Pending commits	You must commit/synchronize pending changes in the experiment proj folder.
7014	Wrong configuration	Check your experiment/conf files, also take a look to the ASLOG/command.log detailed output

### 10.3.1 Default Solution

These issues are usually mistakes from the user input, check the available logs and git resolved issues. Alternative, you can ask for help to Autosubmit team.

---

## 10.4 Platform issues - Critical Error codes. Local [7040-7050] and remote [7050-7060]

Code   Details   Solution
7040   Invalid experiment pkl/db likely due a local platform failure   Should be recovered automatically, if not check if there is a backup file and do it manually
7041   Weird job status   Weird Job status, try to recover experiment(check the recovery how-to for more info) if this issue persist please, report it to gitlab
7050   Connection can't be established.   Check your experiment platform configuration
7050   Failure after a restart, connection can't be restored.   Check or ask (manually) if the remote platforms have any known issues
7051   Invalid ssh configuration.   Check .ssh/config file. Additionally, Check if you can perform a password less connection to that platform.
7052   Scheduler is not installed or correctly configured.   Check if there is a scheduler installed in the remote machine.

### 10.4.1 Default Solution

Check autosubmit log for detailed information, there will be additional error codes.

---

## 10.5 Uncatalogued codes - Critical Error codes [7060+]

Code	Details	Solution
7060	Display issues during monitoring	Use a different output or txt.
7061	Stat command failed	Check Aslogs command output, open a git issue.
7062	Svn issues	Check, in expdef, if url exist.
7063	cp/rsync issues	Check if destination path exist.
7064	Git issues	Check that the proj folder is a well configured git folder. Also, check [GIT] expdef config.
7065	Wrong git configuration	Invalid git url. Check [GIT] expdef config. If issue persists, check if proj folder is a well configured git folder.
7066	Pre-submission feature issues   New feature, this message shouldn't be prompt. Please report it to Git.	
7067	Historical Database not found	Configure [historicdb] PATH = <file_path>.
7068	Monitor output can't be loaded	Try another output method// Check if the experiment is reachable.
7069	Monitor output format invalid	Try another output method.
7070	Bug in code	Contact us via git/e-mail output.
7071	AS can't run in this host	If you think that this is an error, check the .autosubmitrc and modify the allowed/forbidden directives.

### 10.5.1 Default Solution

Check autosubmit log for detailed information, there will be additional error codes.

---

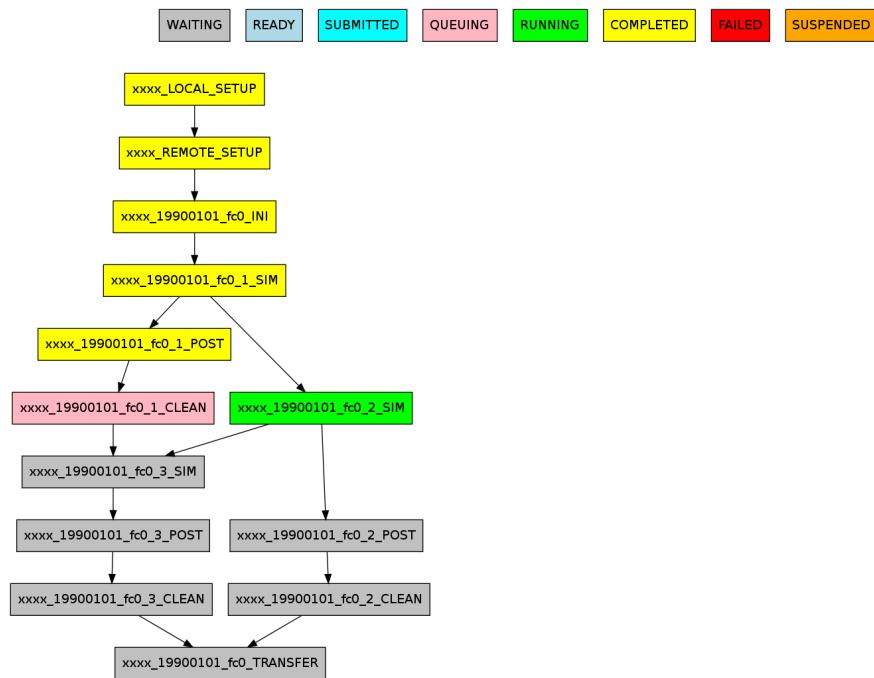

## 10.6 Minor errors - Error codes [6000+]

Code	Details	Solution
6001	Failed to retrieve log files	Automatically, if there aren't bigger issues
6002	Failed reconnection   Automatically, if there aren't bigger issues	
6003	Failed connection, wrong configuration	Check your platform.conf file
6004	Input output issues	Automatically, if there aren't bigger issues
6005	Unable to execute the command	Automatically, if there aren't bigger issues
6006	Failed command	Check err output for more info, command worked but some issue was detected
6007	Broken sFTP connection	Automatically, if there aren't bigger issues
6008	Inconsistent/unexpected job status	Automatically, if there aren't bigger issues
6009	Failed job checker	Automatically, if there aren't bigger issues
6010	Corrupted job_list using backup	Automatically, if it fails, Perform mv <expid>/pkl/job_list_backup.pkl <expid>/pkl/job_list.pkl
6011	Incorrect mail notifier configuration	Double check your mail configuration on job.conf (job status) and auto-submit.conf (email)
6012	Migrate , archive/unarchive I/O issues	Check migrate how-to configuration
6013	Configuration issues	Check log output for more info
6014	Git Can't clone repository submodule   Check submodule url, perform a refresh	
6015	Submission failed	Automatically, if there aren't bigger issues

# CHAPTER 11

## Developing a project

Autosubmit is used at BSC to run EC-Earth. To do that, a git repository has been created that contains the model source code and the scripts used to run the tasks.

11.1: Example of monitoring plot for EC-Earth run with Autosubmit for 1 start date, 1 member and 3 chunks.

The workflow is defined using seven job types, as shown in the figure above. These job types are:

- Local\_setup: prepares a patch for model changes and copies it to HPC.
- Remote\_setup: creates a model copy and applies the patch to it.
- Ini: prepares model to start the simulation of one member.

- Sim: runs a simulation chunk (usually 1 to 3 months).
- Post: post-process outputs for one simulation chunk.
- Clean: removes unnecessary outputs from the simulated chunk.
- Transfer: transfers post-processed outputs to definitive storage.

Since Autosubmit 2.2 the user can select the desired source repository for the experiment project and using a given concrete branch is possible. This introduce a better version control system for project and more options to create new experiments based on different developments by the user. The different projects contain the shell script to run, for each job type (local setup, remote setup, ini, sim, post, clean and transfer) that are platform independent. Additionally the user can modify the sources under proj folder. The executable scripts are created at runtime so the modifications on the sources can be done on the fly.

**Warning:** Autosubmit automatically adds small shell script code blocks in the header and the tailer of your scripts, to control the workflow. Please, remove any exit command in the end of your scripts, e.g. `exit 0`.

---

**Important:** For a complete reference on how to develop an EC-Earth project, please have a look in the following wiki page: <https://earth.bsc.es/wiki/doku.php?id=models:models>

---

# CHAPTER 12

---

## Variables reference

---

Autosubmit uses a variable substitution system to facilitate the development of the templates. This variables can be used on the template in the form %VARIABLE\_NAME%.

### 12.1 Job variables

This variables are relatives to the current job.

- **TASKTYPE**: type of the job, as given on job configuration file.
- **JOBNAME**: current job full name.
- **FAIL\_COUNT**: number of failed attempts to run this job.
- **SDATE**: current startdate.
- **MEMBER**: current member.
- **CHUNK**: current chunk.
- **SPLIT**: current split.
- **DELAY**: current delay.
- **DAY\_BEFORE**: day before the startdate
- **Chunk\_End\_IN\_DAYS**: chunk's length in days
- **Chunk\_START\_DATE**: chunk's start date
- **Chunk\_START\_YEAR**: chunk's start year
- **Chunk\_START\_MONTH**: chunk's start month
- **Chunk\_START\_DAY**: chunk's start day
- **Chunk\_START\_HOUR**: chunk's start hour
- **Chunk\_END\_DATE**: chunk's end date

- **Chunk-END-YEAR**: chunk's end year
- **Chunk-END-MONTH**: chunk's end month
- **Chunk-END-DAY**: chunk's end day
- **Chunk-END-HOUR**: chunk's end hour
- **PREV**: days since startdate at the chunk's start
- **Chunk-FIRST**: True if the current chunk is the first, false otherwise.
- **Chunk-LAST**: True if the current chunk is the last, false otherwise.
- **NUMPROC**: Number of processors that the job will use.
- **NUMTHREADS**: Number of threads that the job will use.
- **NUMTASKS**: Number of tasks that the job will use.
- **HYPERTHREADING**: Detects if hyperthreading is enabled or not.
- **WALLCLOCK**: Number of processors that the job will use.
- **SCRATCH\_FREE\_SPACE**: Percentage of free space required on the scratch.
- **NOTIFY\_ON**: Determine the job statuses you want to be notified.
- **WRAPPER**: Wrapper type, None if wrapper is not being used

## 12.2 Platform variables

This variables are relative to the platforms defined on the jobs conf. A full set of the next variables are defined for each platform defined on the platforms configuration file, substituting {PLATFORM\_NAME} for each platform's name. Also, a suite of variables is defined for the current platform where {PLATFORM\_NAME} is substituted by CURRENT.

- **{PLATFORM\_NAME}\_ARCH**: Platform name
- **{PLATFORM\_NAME}\_HOST**: Platform url
- **{PLATFORM\_NAME}\_USER**: Platform user
- **{PLATFORM\_NAME}\_PROJ**: Platform project
- **{PLATFORM\_NAME}\_BUDG**: Platform budget
- **{PLATFORM\_NAME}\_RESERVATION**: You can configure your reservation id for the given platform.
- **{PLATFORM\_NAME}\_EXCLUSIVITY**: True if you want to request exclusivity nodes.
- **{PLATFORM\_NAME}\_TYPE**: Platform scheduler type
- **{PLATFORM\_NAME}\_VERSION**: Platform scheduler version
- **{PLATFORM\_NAME}\_SCRATCH\_DIR**: Platform's scratch folder path
- **{PLATFORM\_NAME}\_ROOTDIR**: Platform's experiment folder path
- **{PLATFORM\_NAME}\_CUSTOM\_DIRECTIVES**: Platform's custom directives for the resource manager.

---

**Hint:** The variables \_USER, \_PROJ and \_BUDG has no value on the LOCAL platform.

---

---

**Hint:** Until now, the variables `_RESERVATION` and `_EXCLUSIVITY` are only available for MN.

---

It is also defined a suite of variables for the experiment's default platform:

- **HPCARCH**: Default HPC platform name
- **HPCHOST**: Default HPC platform url
- **HPCUSER**: Default HPC platform user
- **HPCPROJ**: Default HPC platform project
- **HPCBUDG**: Default HPC platform budget
- **HPCTYPE**: Default HPC platform scheduler type
- **HPCVERSION**: Default HPC platform scheduler version
- **SCRATCH\_DIR**: Default HPC platform scratch folder path
- **HPCROOTDIR**: Default HPC platform experiment's folder path

## 12.3 Project variables

- **NUMMEMBERS**: number of members of the experiment
- **NUMCHUNKS**: number of chunks of the experiment
- **CHUNKSIZE**: size of each chunk
- **CHUNKSIZEUNIT**: unit of the chunk size. Can be hour, day, month or year.
- **CALENDAR**: calendar used for the experiment. Can be standard or noleap.
- **ROOTDIR**: local path to experiment's folder
- **PROJDIR**: local path to experiment's proj folder

## 12.4 Performance Metrics

Currently, these variables apply only to the report function of Autosubmit. See report.

- **SYPD**: Simulated years per day.
- **ASYPD**: Actual simulated years per day.
- **RSYPD**: Raw simulated years per day.
- **CHSY**: Core hours per simulated year.
- **JPSY**: Joules per simulated year.
- **Parallelization**: Number of cores requested for the simulation job.

For more information about these metrics please visit:

<https://earth.bsc.es/gitlab/wuruchi/autosubmitreact/-/wikis/Performance-Metrics>.

# CHAPTER 13

---

## Module documentation

---

### 13.1 autosubmit

**class** autosubmit.autosubmit.**Autosubmit**

Bases: object

Interface class for autosubmit.

**static archive**(*expid*, *noclean*=*True*, *uncompress*=*True*)

Archives an experiment: call clean (if experiment is of version 3 or later), compress folder to tar.gz and moves to year's folder

#### Parameters

- **clean**, **compress** –
- **expid**(*str*) – experiment identifier

#### Returns

**static change\_status**(*final*, *final\_status*, *job*, *save*)

Set job status to final

#### Parameters

- **final** –
- **final\_status** –
- **job** –

**static check**(*experiment\_id*, *nottransitive*=*False*)

Checks experiment configuration and warns about any detected error or inconsistency.

#### Parameters **experiment\_id**(*str*) – experiment identifier:

**static clean**(*expid*, *project*, *plot*, *stats*)

Clean experiment's directory to save storage space. It removes project directory and outdated plots or stats.

#### Parameters

- **expid** (*str*) – identifier of experiment to clean
- **project** (*bool*) – set True to delete project directory
- **plot** (*bool*) – set True to delete outdated plots
- **stats** (*bool*) – set True to delete outdated stats

```
static configure(advanced, database_path, database_filename, local_root_path, platforms_conf_path, jobs_conf_path, smtp_hostname, mail_from, machine, local)
```

Configure several paths for autosubmit: database, local root and others. Can be configured at system, user or local levels. Local level configuration precedes user level and user level precedes system configuration.

#### Parameters

- **database\_path** (*str*) – path to autosubmit database
- **database\_filename** (*str*) – database filename
- **local\_root\_path** (*str*) – path to autosubmit's experiments' directory
- **platforms\_conf\_path** (*str*) – path to platforms conf file to be used as model for new experiments
- **jobs\_conf\_path** (*str*) – path to jobs conf file to be used as model for new experiments
- **machine** (*bool*) – True if this configuration has to be stored for all the machine users
- **local** (*bool*) – True if this configuration has to be stored in the local path
- **mail\_from** (*str*) –
- **smtp\_hostname** (*str*) –

```
static configure_dialog()
```

Configure several paths for autosubmit interactively: database, local root and others. Can be configured at system, user or local levels. Local level configuration precedes user level and user level precedes system configuration.

```
static create(expid, noplot, hide, output='pdf', group_by=None, expand=[], expand_status=[], notransitive=False, check_wrappers=False, detail=False)
```

Creates job list for given experiment. Configuration files must be valid before executing this process.

#### Parameters

- **expid** (*str*) – experiment identifier
- **noplot** – if True, method omits final plotting of the jobs list. Only needed on large experiments when

plotting time can be much larger than creation time. :type noplot: bool :return: True if successful, False if not :rtype: bool :param hide: hides plot window :type hide: bool :param hide: hides plot window :type hide: bool :param output: plot's file format. It can be pdf, png, ps or svg :type output: str

```
static database_fix(expid)
```

Database methods. Performs a sql dump of the database and restores it.

#### Parameters **expid** (*str*) – experiment identifier

#### Returns

#### Return type

```
static delete(expid, force)
```

Deletes an experiment from database and experiment's folder

**Parameters**

- **expid** (*str*) – identifier of the experiment to delete
- **force** (*bool*) – if True, does not ask for confirmation

**Returns** True if successful, False if not

**Return type** bool

**static describe** (*experiment\_id*)

Show details for specified experiment

**Parameters** **experiment\_id** (*str*) – experiment identifier:

**experiment\_data**

Get the current voltage.

**static expid** (*hpc*, *description*, *copy\_id*=”, *dummy*=*False*, *test*=*False*, *operational*=*False*, *root\_folder*=”)

Creates a new experiment for given HPC

**Parameters**

- **operational** (*bool*) – if true, creates an operational experiment
- **hpc** (*str*) – name of the main HPC for the experiment
- **description** (*str*) – short experiment's description.
- **copy\_id** (*str*) – experiment identifier of experiment to copy
- **dummy** (*bool*) – if true, writes a default dummy configuration for testing
- **test** – if true, creates an experiment for testing

**Returns** experiment identifier. If method fails, returns “.”

**Return type** str

**static generate\_scripts\_andor\_wrappers** (*as\_conf*, *job\_list*, *jobs\_filtered*, *packages\_persistence*, *only\_wrappers*=*False*)

**Parameters**

- **as\_conf** (*AutosubmitConfig () Object*) – Class that handles basic configuration parameters of Autosubmit.
- **job\_list** (*JobList () Object*) – Representation of the jobs of the experiment, keeps the list of jobs inside.
- **jobs\_filtered** (*List () of Job Objects*) – list of jobs that are relevant to the process.
- **packages\_persistence** (*JobPackagePersistence () Object*) – Object that handles local db persistence.
- **only\_wrappers** (*Boolean*) – True when coming from Autosubmit.create(). False when coming from Autosubmit.inspect(),

**Returns** Nothing

**Return type**

**static inspect** (*expid*, *lst*, *filter\_chunks*, *filter\_status*, *filter\_section*, *nottransitive*=*False*, *force*=*False*, *check\_wrapper*=*False*)

Generates cmd files experiment.

**Parameters** `expid` (*str*) – identifier of experiment to be run

**Returns** True if run to the end, False otherwise

**Return type** bool

**static install()**

Creates a new database instance for autosubmit at the configured path

**static migrate** (*experiment\_id*, *offer*, *pickup*, *only\_remote*)

Migrates experiment files from current to other user. It takes mapping information for new user from config files.

**Parameters**

- `experiment_id` – experiment identifier:
- `pickup` –
- `offer` –
- `only_remote` –

**static monitor** (*expid*, *file\_format*, *lst*, *filter\_chunks*, *filter\_status*, *filter\_section*,  
*hide*, *txt\_only=False*, *group\_by=None*, *expand=”, expand\_status=[ ]*,  
*hide\_groups=False*, *notransitive=False*, *check\_wrapper=False*, *txt\_logfiles=False*,  
*detail=False*)

Plots workflow graph for a given experiment with status of each job coded by node color. Plot is created in experiment's plot folder with name <*expid*>\_<*date*>\_<*time*>. <*file\_format*>

**Parameters**

- `expid` (*str*) – identifier of the experiment to plot
- `file_format` (*str*) – plot's file format. It can be pdf, png, ps or svg
- `lst` (*str*) – list of jobs to change status
- `filter_chunks` (*str*) – chunks to change status
- `filter_status` (*str*) – current status of the jobs to change status
- `filter_section` (*str*) – sections to change status
- `hide` (*bool*) – hides plot window
- `txt_only` (*bool*) – workflow will only be written as text
- `group_by` (*bool*) – workflow will only be written as text
- `expand` (*str*) – Filtering of jobs for it's visualization
- `expand_status` (*str*) – Filtering of jobs for it's visualization
- `hide_groups` (*bool*) – Simplified workflow illustration by encapsulating the jobs.
- `notransitive` (*bool*) – workflow will only be written as text
- `check_wrapper` (*bool*) – Shows a preview of how the wrappers will look
- `notransitive` – Some dependencies will be omitted
- `detail` (*bool*) – better text format representation but more expensive

**static parse\_args()**

Parse arguments given to an executable and start execution of command given

**static pkl\_fix(expid)**

Tries to find a backup of the pkl file and restores it. Verifies that autosubmit is not running on this experiment.

**Parameters** `expid` (`str`) – experiment identifier

**Returns**

**Return type**

**static recovery(expid, noplot, save, all\_jobs, hide, group\_by=None, expand=[], expand\_status=[], notransitive=False, no\_recover\_logs=False, detail=False, force=False)**

Method to check all active jobs. If COMPLETED file is found, job status will be changed to COMPLETED, otherwise it will be set to WAITING. It will also update the jobs list.

**Parameters**

- `expid` (`str`) – identifier of the experiment to recover
- `save` (`bool`) – If true, recovery saves changes to the jobs list
- `all_jobs` (`bool`) – if True, it tries to get completed files for all jobs, not only active.
- `hide` (`bool`) – hides plot window
- `force` (`bool`) – Allows to restore the workflow even if there are running jobs

**static refresh(expid, model\_conf, jobs\_conf)**

Refresh project folder for given experiment

**Parameters**

- `model_conf` (`bool`) –
- `jobs_conf` (`bool`) –
- `expid` (`str`) – experiment identifier

**static report(expid, template\_file\_path='', show\_all\_parameters=False, folder\_path='', placeholders=False)**

Show report for specified experiment :param expid: experiment identifier :type expid: str :param template\_file\_path: path to template file :type template\_file\_path: str :param show\_all\_parameters: show all parameters :type show\_all\_parameters: bool :param folder\_path: path to folder :type folder\_path: str :param placeholders: show placeholders :type placeholders: bool

**static rerun\_recovery(expid, job\_list, rerun\_list, as\_conf)**

Method to check all active jobs. If COMPLETED file is found, job status will be changed to COMPLETED, otherwise it will be set to WAITING. It will also update the jobs list.

**Parameters**

- `expid` (`str`) – identifier of the experiment to recover
- `job_list` (`JobList`) – job list to update
- `rerun_list` (`list`) – list of jobs to rerun
- `as_conf` (`AutosubmitConfig`) – AutosubmitConfig object

**Returns**

**static run\_experiment(expid, notransitive=False, update\_version=False, start\_time=None, start\_after=None, run\_members=None)**

Runs and experiment (submitting all the jobs properly and repeating its execution in case of failure).

**Parameters** `expid` (`str`) – identifier of experiment to be run

**Returns** True if run to the end, False otherwise

**Return type** bool

```
static set_status(expid, noplott, save, final, lst, filter_chunks, filter_status, filter_section, filter_type_chunk, hide, group_by=None, expand=[], expand_status=[], notransitive=False, check_wrapper=False, detail=False)
```

Set status

**Parameters**

- **expid** (str) – experiment identifier
- **save** (bool) – if true, saves the new jobs list
- **final** (str) – status to set on jobs
- **lst** (str) – list of jobs to change status
- **filter\_chunks** (str) – chunks to change status
- **filter\_status** (str) – current status of the jobs to change status
- **filter\_section** (str) – sections to change status
- **hide** (bool) – hides plot window

```
static statistics(expid, filter_type, filter_period, file_format, hide, notransitive=False)
```

Plots statistics graph for a given experiment. Plot is created in experiment's plot folder with name <expid>\_<date>\_<time>.<file\_format>

**Parameters**

- **expid** (str) – identifier of the experiment to plot
- **filter\_type** – type of the jobs to plot
- **filter\_period** – period to plot
- **file\_format** (str) – plot's file format. It can be pdf, png, ps or svg
- **hide** (bool) – hides plot window
- **notransitive** – Reduces workflow linkage complexity

```
static submit_ready_jobs(as_conf, job_list, platforms_to_test, packages_persistence, inspect=False, only_wrappers=False, hold=False)
```

Gets READY jobs and send them to the platforms if there is available space on the queues

**Parameters**

- **as\_conf** (AutosubmitConfig object) – autosubmit config object
- **job\_list** (JobList object) – job list to check
- **platforms\_to\_test** (set of Platform Objects, e.g. SgePlatform(), LsfPlatform()) – platforms used
- **packages\_persistence** (JobPackagePersistence object) – Handles database per experiment.
- **inspect** (Boolean) – True if coming from generate\_scripts\_and\_wrappers().
- **only\_wrappers** (Boolean) – True if it comes from create -cw, False if it comes from inspect -cw.

**Returns** True if at least one job was submitted, False otherwise

**Return type** Boolean

**static test** (*expid, chunks, member=None, start\_date=None, hpc=None, branch=None*)

Method to conduct a test for a given experiment. It creates a new experiment for a given experiment with a given number of chunks with a random start date and a random member to be run on a random HPC.

**Parameters**

- **expid** (*str*) – experiment identifier
- **chunks** (*int*) – number of chunks to be run by the experiment
- **member** (*str*) – member to be used by the test. If None, it uses a random one from which are defined on the experiment.
- **start\_date** (*str*) – start date to be used by the test. If None, it uses a random one from which are defined on the experiment.
- **hpc** (*str*) – HPC to be used by the test. If None, it uses a random one from which are defined on the experiment.
- **branch** (*str*) – branch or revision to be used by the test. If None, it uses configured branch.

**Returns** True if test was successful, False otherwise

**Return type** bool

**static testcase** (*copy\_id, description, chunks=None, member=None, start\_date=None, hpc=None, branch=None*)

Method to create a test case. It creates a new experiment whose id starts by ‘t’.

**Parameters**

- **copy\_id** (*str*) – experiment identifier
- **description** (*str*) – test case experiment description
- **chunks** (*int*) – number of chunks to be run by the experiment. If None, it uses configured chunk(s).
- **member** (*str*) – member to be used by the test. If None, it uses configured member(s).
- **start\_date** (*str*) – start date to be used by the test. If None, it uses configured start date(s).
- **hpc** (*str*) – HPC to be used by the test. If None, it uses configured HPC.
- **branch** (*str*) – branch or revision to be used by the test. If None, it uses configured branch.

**Returns** test case id

**Return type** str

**static unarchive** (*experiment\_id, uncompressed=True*)

Unarchives an experiment: uncompress folder from tar.gz and moves to experiments root folder

**Parameters**

- **experiment\_id** (*str*) – experiment identifier
- **uncompressed** (*bool*) – if True, the tar file is uncompressed

**static update\_version** (*expid*)

Refresh experiment version with the current autosubmit version :param expid: experiment identifier :type expid: str

```
class autosubmit.autosubmit.MyParser(prog=None, usage=None, description=None, epilog=None, parents=[], formatter_class=<class 'argparse.HelpFormatter'>, prefix_chars='-', fromfile_prefix_chars=None, argument_default=None, conflict_handler='error', add_help=True, allow_abbrev=True)
```

Bases: argparse.ArgumentParser

**add\_argument** (*dest*, ..., *name*=*value*, ...)

add\_argument(*option\_string*, *option\_string*, ..., *name*=*value*, ...)

**error** (*message*: string)

Prints a usage message incorporating the message to stderr and exits.

If you override this in a subclass, it should not return – it should either exit or raise an exception.

```
autosubmit.autosubmit.signal_handler(signal_received, frame)
```

Used to handle interrupt signals, allowing autosubmit to clean before exit

#### Parameters

- **signal\_received** –
- **frame** –

```
autosubmit.autosubmit.signal_handler_create(signal_received, frame)
```

Used to handle KeyboardInterrupt signals while the create method is being executed

#### Parameters

- **signal\_received** –
- **frame** –

## 13.2 autosubmit.config

### 13.2.1 autosubmit.config.basicConfig

```
class autosubmit.config.basicConfig.BasicConfig
```

Bases: object

Class to manage configuration for Autosubmit path, database and default values for new experiments

**static read()**

Reads configuration from .autosubmitrc files, first from /etc., then for user directory and last for current path.

### 13.2.2 autosubmit.config.config\_common

```
class autosubmit.config.config_common.AutoSubmitConfig(expid, basic_config, parser_factory)
```

Bases: object

Class to handle experiment configuration coming from file or database

**Parameters** **expid** (*str*) – experiment identifier

**check\_autosubmit\_conf()**

Checks experiment's autosubmit configuration file.

**Returns** True if everything is correct, False if it finds any error

**Return type** bool

**check\_conf\_files** (*running\_time=False, first\_load=True*)

Checks configuration files (autosubmit, experiment jobs and platforms), looking for invalid values, missing required options. Print results in log

**Returns** True if everything is correct, False if it finds any error

**Return type** bool

**check\_expdef\_conf()**

Checks experiment's experiment configuration file.

**Returns** True if everything is correct, False if it finds any error

**Return type** bool

**check\_jobs\_conf()**

Checks experiment's jobs configuration file.

**Returns** True if everything is correct, False if it finds any error

**Return type** bool

**check\_platforms\_conf()**

Checks experiment's queues configuration file.

**check\_proj()**

Checks project config file

**Returns** True if everything is correct, False if it finds any error

**Return type** bool

**check\_proj\_file()**

Add a section header to the project's configuration file (if not exists)

**deep\_normalize** (*data*)

normalize a nested dictionary or similar mapping to uppercase. Modify source in place.

**deep\_parameters\_export** (*data*)

Export all variables of this experiment. Resultant format will be Section.{subsections1... subsectionN} = Value. In other words, it plain the dictionary into one level

**deep\_read\_loops** (*data, for\_keys=[], long\_key=""*)

Update a nested dictionary or similar mapping. Modify source in place.

**deep\_update** (*unified\_config, new\_dict*)

Update a nested dictionary or similar mapping. Modify source in place.

**experiment\_file**

Returns experiment's config file name

**file\_modified** (*file, prev\_mod\_time*)

Function to check if a file has been modified. :param file: path :return: bool,new\_time

**get\_chunk\_ini** (*default=1*)

Returns the first chunk from where the experiment will start

**Parameters default -**

**Returns** initial chunk

**Return type** int

```
get_chunk_size(default=1)
    Chunk Size as defined in the expdef file.

    Returns Chunksize, 1 as default.

    Return type int

get_chunk_size_unit()
    Unit for the chunk length

    Returns Unit for the chunk length Options: {hour, day, month, year}

    Return type str

get.communications_library()
    Returns the communications library from autosubmit's config file. Paramiko by default.

    Returns communications library

    Return type str

get_copy_remote_logs()
    Returns if the user has enabled the logs local copy from autosubmit's config file

    Returns if logs local copy

    Return type str

get.current_host(section)
    Returns the user to be changed from platform config file.

    Returns migrate user to

    Return type str

get.current_project(section)
    Returns the project to be changed from platform config file.

    Returns migrate user to

    Return type str

get.current_user(section)
    Returns the user to be changed from platform config file.

    Returns migrate user to

    Return type str

get.custom_directives(section)
    Gets custom directives needed for the given job type :param section: job type :type section: str :return: custom directives needed :rtype: str

get.date_list()
    Returns startdates list from experiment's config file

    Returns experiment's startdates

    Return type list

get.default_job_type()
    Returns the default job type from experiment's config file

    Returns default type such as bash, python, r...

    Return type str
```

**get\_delay\_retry\_time()**  
Returns delay time from autosubmit's config file

**Returns** safety sleep time

**Return type** int

**get\_dependencies(section='None')**  
Returns dependencies list from jobs config file

**Returns** experiment's members

**Return type** list

**get\_disable\_recovery\_threads(section)**  
Returns FALSE/TRUE :return: recovery\_threads\_option :rtype: str

**get\_export(section)**  
Gets command line for being submitted with :param section: job type :type section: str :return: wallclock time :rtype: str

**get\_extensible\_wallclock(wrapper={})**  
Gets extend\_wallclock for the given wrapper

**Parameters** **wrapper** (*dict*) – wrapper

**Returns** extend\_wallclock

**Return type** int

**get\_fetch\_single\_branch()**  
Returns fetch single branch from experiment's config file Default is -single-branch :return: fetch\_single\_branch(Y/N) :rtype: str

**get\_file\_jobs\_conf()**  
Returns path to project config file from experiment config file

**Returns** path to project config file

**Return type** str

**get\_file\_project\_conf()**  
Returns path to project config file from experiment config file

**Returns** path to project config file

**Return type** str

**get\_full\_config\_as\_json()**  
Return config as json object

**get\_git\_project\_branch()**  
Returns git branch from experiment's config file

**Returns** git branch

**Return type** str

**get\_git\_project\_commit()**  
Returns git commit from experiment's config file

**Returns** git commit

**Return type** str

**get\_git\_project\_origin()**  
Returns git origin from experiment config file

**Returns** git origin

**Return type** str

**get\_git\_remote\_project\_root()**

Returns remote machine ROOT PATH

**Returns** git commit

**Return type** str

**get\_jobs\_sections()**

Returns the list of sections defined in the job's config file

**Returns** sections

**Return type** list

**get\_local\_project\_path()**

Gets path to origin for local project

**Returns** path to local project

**Return type** str

**get\_mails\_to()**

Returns the address where notifications will be sent from autosubmit's config file

**Returns** mail address

**Return type** [str]

**get\_max\_processors()**

Returns max processors from autosubmit's config file

**Return type** str

**get\_max\_waiting\_jobs()**

Returns max number of waiting jobs from autosubmit's config file

**Returns** main platforms

**Return type** int

**get\_max\_wallclock()**

Returns max wallclock

**Return type** str

**get\_max\_wrapped\_jobs(wrapper={})**

Returns the maximum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** maximum number of jobs (or total jobs)

**Return type** int

**get\_max\_wrapped\_jobs\_horizontal(wrapper={})**

Returns the maximum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** maximum number of jobs (or total jobs)

**Return type** int

**get\_max\_wrapped\_jobs\_vertical (wrapper={})**  
Returns the maximum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** maximum number of jobs (or total jobs)

**Return type** int

**get\_member\_list (run\_only=False)**  
Returns members list from experiment's config file

**Returns** experiment's members

**Return type** list

**get\_memory (section)**  
Gets memory needed for the given job type :param section: job type :type section: str :return: memory needed :rtype: str

**get\_memory\_per\_task (section)**  
Gets memory per task needed for the given job type :param section: job type :type section: str :return: memory per task needed :rtype: str

**get\_migrate\_duplicate (section)**  
Returns the user to change to from platform config file.

**Returns** migrate user to

**Return type** str

**get\_migrate\_host\_to (section)**  
Returns the host to change to from platform config file.

**Returns** host\_to

**Return type** str

**get\_migrate\_project\_to (section)**  
Returns the project to change to from platform config file.

**Returns** migrate project to

**Return type** str

**get\_migrate\_user\_to (section)**  
Returns the user to change to from platform config file.

**Returns** migrate user to

**Return type** str

**get\_min\_wrapped\_jobs (wrapper={})**  
Returns the minimum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** minim number of jobs (or total jobs)

**Return type** int

**get\_min\_wrapped\_jobs\_horizontal (wrapper={})**  
Returns the maximum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** maximum number of jobs (or total jobs)

**Return type** int

**get\_min\_wrapped\_jobs\_vertical**(*wrapper*={})  
Returns the maximum number of jobs that can be wrapped together as configured in autosubmit's config file

**Returns** maximum number of jobs (or total jobs)

**Return type** int

**get\_notifications()**  
Returns if the user has enabled the notifications from autosubmit's config file

**Returns** if notifications

**Return type** string

**get\_notifications\_crash()**  
Returns if the user has enabled the notifications from autosubmit's config file

**Returns** if notifications

**Return type** string

**get\_num\_chunks()**  
Returns number of chunks to run for each member

**Returns** number of chunks

**Return type** int

**get\_output\_type()**  
Returns default output type, pdf if none

**Returns** output type

**Return type** string

**get\_parse\_two\_step\_start()**  
Returns two-step start jobs

**Returns** jobs\_list

**Return type** str

**static get\_parser**(*parser\_factory*, *file\_path*)  
Gets parser for given file

**Parameters**

- **parser\_factory** –
- **file\_path** (*Path*) – path to file to be parsed

**Returns** parser

**Return type** YAMLParser

**get\_platform()**  
Returns main platforms from experiment's config file

**Returns** main platforms

**Return type** str

**get\_processors**(*section*)  
Gets processors needed for the given job type :param section: job type :type section: str :return: wallclock time :rtype: str

```
get_project_destination()
    Returns git commit from experiment's config file

        Returns git commit

        Return type str

get_project_dir()
    Returns experiment's project directory

        Returns experiment's project directory

        Return type str

get_project_type()
    Returns project type from experiment config file

        Returns project type

        Return type str

get_remote_dependencies()
    Returns if the user has enabled the PRESUBMISSION configuration parameter from autosubmit's config file

        Returns if remote dependencies

        Return type string

get_rerun()
    Returns startdates list from experiment's config file

        Returns rerun value

        Return type bool

get_rerun_jobs()
    Returns rerun jobs

        Returns jobs_list

        Return type str

get_retrials()
    Returns max number of retrials for job from autosubmit's config file

        Returns safety sleep time

        Return type int

get_safetysleepetime()
    Returns safety sleep time from autosubmit's config file

        Returns safety sleep time

        Return type int

get_scratch_free_space(section)
    Gets scratch free space needed for the given job type :param section: job type :type section: str :return: percentage of scratch free space needed :rtype: int

get_section(section, d_value='', must_exists=False)
    Gets any section if it exists within the dictionary, else returns None or error if must exist. :param section: section to get :type section: list :param d_value: default value to return if section does not exist :type d_value: str :param must_exists: if true, error is raised if section does not exist :type must_exists: bool :return: section value :rtype: str
```

**get\_storage\_type()**  
Returns the storage system from autosubmit's config file. Pkl by default.

**Returns** communications library

**Return type** str

**get\_submodules\_list()**  
Returns submodules list from experiment's config file Default is –recursive :return: submodules to load  
:rtype: list

**get\_svn\_project\_revision()**  
Get revision for subversion project

**Returns** revision for subversion project

**Return type** str

**get\_svn\_project\_url()**  
Gets subversion project url

**Returns** subversion project url

**Return type** str

**get\_synchronize(section)**  
Gets wallclock for the given job type :param section: job type :type section: str :return: wallclock time  
:rtype: str

**get\_tasks(section)**  
Gets tasks needed for the given job type :param section: job type :type section: str :return: tasks (processes) per host :rtype: str

**get\_threads(section)**  
Gets threads needed for the given job type :param section: job type :type section: str :return: threads needed :rtype: str

**get\_total\_jobs()**  
Returns max number of running jobs from autosubmit's config file

**Returns** max number of running jobs

**Return type** int

**get\_version()**  
Returns version number of the current experiment from autosubmit's config file

**Returns** version

**Return type** str

**get\_wallclock(section)**  
Gets wallclock for the given job type :param section: job type :type section: str :return: wallclock time  
:rtype: str

**get\_wchunkinc(section)**  
Gets the chunk increase to wallclock :param section: job type :type section: str :return: wallclock increase per chunk :rtype: str

**get\_wrapper\_check\_time(wrapper=None)**  
Returns time to check the status of jobs in the wrapper

**Returns** wrapper check time

**Return type** int

**get\_wrapper\_export** (*wrapper=*{})  
Returns modules variable from wrapper

**Returns** string

**Return type** string

**get\_wrapper\_jobs** (*wrapper=None*)  
Returns the jobs that should be wrapped, configured in the autosubmit's config

**Returns** expression (or none)

**Return type** string

**get\_wrapper\_machinefiles** (*wrapper=*{})  
Returns the strategy for creating the machinefiles in wrapper jobs

**Returns** machinefiles function to use

**Return type** string

**get\_wrapper\_method** (*wrapper=*{})  
Returns the method of make the wrapper

**Returns** method

**Return type** string

**get\_wrapper\_policy** (*wrapper=*{})  
Returns what kind of policy (flexible, strict, mixed ) the user has configured in the autosubmit's config

**Returns** wrapper type (or none)

**Return type** string

**get\_wrapper\_queue** (*wrapper=*{})  
Returns the wrapper queue if not defined, will be the one of the first job wrapped

**Returns** expression (or none)

**Return type** string

**get\_wrapper\_retrials** (*wrapper=*{})  
Returns max number of retrials for job from autosubmit's config file

**Returns** safety sleep time

**Return type** int

**get\_wrapper\_type** (*wrapper=*{})  
Returns what kind of wrapper (VERTICAL, MIXED-VERTICAL, HORIZONTAL, HYBRID, MULTI NONE) the user has configured in the autosubmit's config

**Returns** wrapper type (or none)

**Return type** string

**get\_wrappers()**  
Returns the jobs that should be wrapped, configured in the autosubmit's config

**Returns** expression

**Return type** dict

**get\_x11** (*section*)  
Active X11 for this section :param section: job type :type section: str :return: false/true :rtype: str

```
get_x11_jobs()
    Returns the jobs that should support x11, configured in the autosubmit's config

    Returns expression (or none)

    Return type string

jobs_file
    Returns project's jobs file name

load_parameters()
    Load all experiment data :return: a dictionary containing tuples [parameter_name, parameter_value]
    :rtype: dict

load_platform_parameters()
    Load parameters from platform config files.

    Returns a dictionary containing tuples [parameter_name, parameter_value]

    Return type dict

load_section_parameters(job_list, as_conf, submitter)
    Load parameters from job config files.

    Returns a dictionary containing tuples [parameter_name, parameter_value]

    Return type dict

normalize_variables(data)
    Apply some memory internal variables to normalize it format. (right now only dependencies)

platforms_file
    Returns experiment's platforms config file name

    Returns platforms config file's name

    Return type str

platforms_parser
    Returns experiment's platforms parser object

    Returns platforms config parser object

    Return type SafeConfigParser

project_file
    Returns project's config file name

reload(first_load=False)
    Creates parser objects for configuration files

set_expid(exp_id)
    Set experiment identifier in autosubmit and experiment config files

    Parameters exp_id(str) – experiment identifier to store

set_git_project_commit(as_conf)
    Function to register in the configuration the commit SHA of the git project version. :param as_conf:
    Configuration class for exteriment :type as_conf: AutosubmitConfig

set_new_host(section, new_host)
    Sets new host for given platform :param new_host: :param section: platform name :type: str

set_new_project(section, new_project)
    Sets new project for given platform :param new_project: :param section: platform name :type: str
```

---

**set\_new\_user** (*section, new\_user*)  
Sets new user for given platform :param new\_user: :param section: platform name :type: str

**set\_platform** (*hpc*)  
Sets main platforms in experiment's config file

**Parameters** **hpc** – main platforms

**Type** str

**set\_safetysleepetime** (*sleep\_time*)  
Sets autosubmit's version in autosubmit's config file

**Parameters** **sleep\_time** (*int*) – value to set

**set\_version** (*autosubmit\_version*)  
Sets autosubmit's version in autosubmit's config file

**Parameters** **autosubmit\_version** (*str*) – autosubmit's version

**unify\_conf()**  
Unifies all configuration files into a single dictionary. Custom files will be able to override the default configuration.

### 13.3 autosubmit.database

Module containing functions to manage autosubmit's database.

**exception** `autosubmit.database.db_common.DbException(message)`

Exception class for database errors

`autosubmit.database.db_common.check_db()`

Checks if database file exist

**Returns** None if exists, terminates program if not

`autosubmit.database.db_common.check_experiment_exists(name, error_on_inexistence=True)`

Checks if exist an experiment with the given name. Anti-lock version.

**Parameters**

- **error\_on\_inexistence** (*bool*) – if True, adds an error log if experiment does not exist
- **name** (*str*) – Experiment name

**Returns** If experiment exists returns true, if not returns false

**Return type** bool

`autosubmit.database.db_common.close_conn(conn, cursor)`

Commits changes and close connection to database

**Parameters**

- **conn** (*sqlite3.Connection*) – connection to close
- **cursor** (*sqlite3.Cursor*) – cursor to close

`autosubmit.database.db_common.create_db(qry)`

Creates a new database for autosubmit

**Parameters** **qry** (*str*) – query to create the new database

```
autosubmit.database.db_common.delete_experiment(experiment_id)
```

Removes experiment from database. Anti-lock version.

**Parameters** **experiment\_id** (*str*) – experiment identifier

**Returns** True if delete is successful

**Return type** bool

```
autosubmit.database.db_common.get_autosubmit_version(expid)
```

Get the minimum autosubmit version needed for the experiment. Anti-lock version.

**Parameters** **expid** (*str*) – Experiment name

**Returns** If experiment exists returns the autosubmit version for it, if not returns None

**Return type** str

```
autosubmit.database.db_common.last_name_used(test=False, operational=False)
```

Gets last experiment identifier used. Anti-lock version.

**Parameters**

- **test** (*bool*) – flag for test experiments

- **operational** – flag for operational experiments

**Returns** last experiment identifier used, ‘empty’ if there is none

**Return type** str

```
autosubmit.database.db_common.open_conn(check_version=True)
```

Opens a connection to database

**Parameters** **check\_version** (*bool*) – If true, check if the database is compatible with this autosubmit version

**Returns** connection object, cursor object

**Return type** sqlite3.Connection, sqlite3.Cursor

```
autosubmit.database.db_common.save_experiment(name, description, version)
```

Stores experiment in database. Anti-lock version.

**Parameters**

- **version** (*str*) –

- **name** (*str*) – experiment’s name

- **description** (*str*) – experiment’s description

```
autosubmit.database.db_common.update_experiment_descrip_version(name, description=None, version=None)
```

Updates the experiment’s description and/or version. Anti-lock version.

**Parameters**

- **name** – experiment name (expid)

- **description** – experiment new description

- **version** – experiment autosubmit version

**Rtype** **name** str

**Rtype** **description** str

**Rtype** version str

**Returns** If description has been update, True; otherwise, False.

**Return type** bool

## 13.4 autosubmit.git

**class** autosubmit.git.autosubmit\_git.**AutosubmitGit**(*expid*)

Class to handle experiment git repository

**Parameters** **expid**(str) – experiment identifier

**static check\_commit**(*as\_conf*)

Function to check uncommitted changes

**Parameters** **as\_conf**(*autosubmit.config.AutosubmitConfig*) – experiment configuration

**static clean\_git**(*as\_conf*)

Function to clean space on BasicConfig.LOCAL\_ROOT\_DIR/git directory.

**Parameters** **as\_conf**(*autosubmit.config.AutosubmitConfig*) – experiment configuration

**static clone\_repository**(*as\_conf*, *force*, *hpcarch*)

Clones a specified git repository on the project folder

**Parameters**

- **as\_conf**(*autosubmit.config.AutosubmitConfig*) – experiment configuration

- **force**(bool) – if True, it will overwrite any existing clone

- **hpcarch** – current main platform

**Returns** True if clone was successful, False otherwise

## 13.5 autosubmit.job

Main module for Autosubmit. Only contains an interface class to all functionality implemented on Autosubmit

**class** autosubmit.job.job.**Job**(*name*, *job\_id*, *status*, *priority*)

Class to handle all the tasks with Jobs at HPC. A job is created by default with a name, a jobid, a status and a type. It can have children and parents. The inheritance reflects the dependency between jobs. If Job2 must wait until Job1 is completed then Job2 is a child of Job1. Inversely Job1 is a parent of Job2

**Parameters**

- **name**(str) – job's name
- **job\_id**(int) – job's id
- **status**(Status) – job initial status
- **priority**(int) – job's priority

**add\_edge\_info**(*parent\_name*, *special\_variables*)

Adds edge information to the job

### Parameters

- **parent\_name** (*str*) – parent name
- **special\_variables** (*dict*) – special variables

#### **add\_parent** (\**parents*)

Add parents for the job. It also adds current job as a child for all the new parents

### Parameters **parents** (\*Job) – job's parents to add

#### **check\_completion** (*default\_status=-1, over\_wallclock=False*)

Check the presence of *COMPLETED* file. Change status to COMPLETED if *COMPLETED* file exists and to FAILED otherwise. :param default\_status: status to set if job is not completed. By default, is FAILED :type default\_status: Status

#### **check\_end\_time** ()

Returns end time from stat file

**Returns** date and time

**Return type** str

#### **check\_retrials\_end\_time** ()

Returns list of end datetime for retrials from total stats file

**Returns** date and time

**Return type** list[int]

#### **check\_retrials\_start\_time** ()

Returns list of start datetime for retrials from total stats file

**Returns** date and time

**Return type** list[int]

#### **check\_retrials\_submit\_time** ()

Returns list of submit datetime for retrials from total stats file

**Returns** date and time

**Return type** list[int]

#### **check\_running\_after** (*date\_limit*)

Checks if the job was running after the given date :param date\_limit: reference date :type date\_limit: datetime.datetime :return: True if job was running after the given date, false otherwise :rtype: bool

#### **check\_script** (*as\_conf, parameters, show\_logs=False*)

Checks if script is well-formed

### Parameters

- **parameters** (*dict*) – script parameters
- **as\_conf** ([AutosubmitConfig](#)) – configuration file
- **show\_logs** (*Bool*) – Display output

**Returns** true if no problem has been detected, false otherwise

**Return type** bool

#### **check\_start\_time** ()

Returns job's start time

**Returns** start time

**Return type** str

**check\_started\_after** (*date\_limit*)

Checks if the job started after the given date :param date\_limit: reference date :type date\_limit: datetime.datetime :return: True if job started after the given date, false otherwise :rtype: bool

**children**

Returns a list containing all children of the job

**Returns** child jobs

**Return type** set

**children\_names\_str**

Comma separated list of children's names

**compare\_by\_id** (*other*)

Compare jobs by ID

**Parameters** *other* ([Job](#)) – job to compare

**Returns** comparison result

**Return type** bool

**compare\_by\_name** (*other*)

Compare jobs by name

**Parameters** *other* ([Job](#)) – job to compare

**Returns** comparison result

**Return type** bool

**compare\_by\_status** (*other*)

Compare jobs by status value

**Parameters** *other* ([Job](#)) – job to compare

**Returns** comparison result

**Return type** bool

**create\_script** (*as\_conf*)

Creates script file to be run for the job

**Parameters** *as\_conf* ([AutosubmitConfig](#)) – configuration object

**Returns** script's filename

**Return type** str

**delete\_child** (*child*)

Removes a child from the job

**Parameters** *child* ([Job](#)) – child to remove

**delete\_parent** (*parent*)

Remove a parent from the job

**Parameters** *parent* ([Job](#)) – parent to remove

**get\_last\_retrials** ()

Returns the retrials of a job, including the last COMPLETED run. The selection stops, and does not include, when the previous COMPLETED job is located or the list of registers is exhausted.

**Returns** list of dates of retrial [submit, start, finish] in datetime format

**Return type** list of list

**has\_children()**  
Returns true if job has any children, else return false

**Returns** true if job has any children, otherwise return false

**Return type** bool

**has\_parents()**  
Returns true if job has any parents, else return false

**Returns** true if job has any parent, otherwise return false

**Return type** bool

**inc\_fail\_count()**  
Increments fail count

**static is\_a\_completed\_retrial(fields)**  
Returns true only if there are 4 fields: submit start finish status, and status equals COMPLETED.

**is\_ancestor(job)**  
Check if the given job is an ancestor :param job: job to be checked if is an ancestor :return: True if job is an ancestor, false otherwise :rtype bool

**is\_over\_wallclock(start\_time, wallclock)**  
Check if the job is over the wallclock time, it is an alternative method to avoid platform issues :param start\_time: :param wallclock: :return:

**is\_parent(job)**  
Check if the given job is a parent :param job: job to be checked if is a parent :return: True if job is a parent, false otherwise :rtype bool

**log\_job()**  
Prints job information in log

**long\_name**  
Job's long name. If not setted, returns name

**Returns** long name

**Return type** str

**parents**  
Returns parent jobs list

**Returns** parent jobs

**Return type** set

**platform**  
Returns the platform to be used by the job. Chooses between serial and parallel platforms  
:return HPCPlatform object for the job to use :rtype: HPCPlatform

**print\_job()**  
Prints debug information about the job

**print\_parameters()**  
Print sjob parameters in log

**queue**  
Returns the queue to be used by the job. Chooses between serial and parallel platforms  
:return HPCPlatform object for the job to use :rtype: HPCPlatform

**`remove_redundant_parents()`**

Checks if a parent is also an ancestor, if true, removes the link in both directions. Useful to remove redundant dependencies.

**`status_str`**

String representation of the current status

**`total_processors`**

Number of processors requested by job. Reduces ‘:’ separated format if necessary.

**`update_content(as_conf)`**

Create the script content to be run for the job

**Parameters** `as_conf` (`config`) – config

**Returns** script code

**Return type** str

**`update_parameters(as_conf, parameters, default_parameters={'M': '%M%', 'M_': '%M_%', 'Y': '%Y%', 'Y_': '%Y_%', 'd': '%d%', 'd_': '%d_%', 'm': '%m%', 'm_': '%m_%'})`**

Refresh parameters value

**Parameters**

- `default_parameters` (`dict`) –
- `as_conf` (`AutosubmitConfig`) –
- `parameters` (`dict`) –

**`update_status(as_conf, failed_file=False)`**

Updates job status, checking COMPLETED file if needed

**Parameters**

- `copy_remote_logs` – boolean, if True, copies remote logs to local
- `failed_file` – boolean, if True, checks if the job failed

**Returns****`write_end_time(completed, enabled=False)`**

Writes ends date and time to TOTAL\_STATS file :param completed: True if job was completed successfully, False otherwise :type completed: bool

**`write_start_time(enabled=False)`**

Writes start date and time to TOTAL\_STATS file :return: True if succesful, False otherwise :rtype: bool

**`write_submit_time(enabled=False, hold=False)`**

Writes submit date and time to TOTAL\_STATS file. It doesn't write if hold == True.

**`write_total_stat_by_retries(total_stats, first_retry=False)`**

Writes all data to TOTAL\_STATS file :param total\_stats: data gathered by the wrapper :type total\_stats: dict :param first\_retry: True if this is the first retry, False otherwise :type first\_retry: bool

**`class autosubmit.job.JobWrapper(name, job_id, status, priority, job_list, total_wallclock, num_processors, platform, as_config, hold)`**

Defines a wrapper from a package.

Calls Job constructor.

**Parameters**

- `name` (`String`) – Name of the Package

- **job\_id** (*Integer*) – ID of the first Job of the package
- **status** (*String*) – ‘READY’ when coming from submit\_ready\_jobs()
- **priority** (*Integer*) – 0 when coming from submit\_ready\_jobs()
- **job\_list** (*List () of Job () objects*) – List of jobs in the package
- **total\_wallclock** (*String Formatted*) – Wallclock of the package
- **num\_processors** (*Integer*) – Number of processors for the package
- **platform** (*Platform Object. e.g. EcPlatform()*) – Platform object defined for the package
- **as\_config** (*AutosubmitConfig object*) – Autosubmit basic configuration object

**class autosubmit.job.job\_common.StatisticsSnippetBash**

Class to handle the statistics snippet of a job. It contains header and tailer for local and remote jobs

**class autosubmit.job.job\_common.StatisticsSnippetEmpty**

Class to handle the statistics snippet of a job. It contains header and footer for local and remote jobs

**class autosubmit.job.job\_common.StatisticsSnippetPython (version='3')**

Class to handle the statistics snippet of a job. It contains header and tailer for local and remote jobs

**class autosubmit.job.job\_common.StatisticsSnippetR**

Class to handle the statistics snippet of a job. It contains header and tailer for local and remote jobs

**class autosubmit.job.job\_common.Status**

Class to handle the status of a job

**class autosubmit.job.job\_common.Type**

Class to handle the status of a job

**autosubmit.job.job\_common.increase\_wallclock\_by\_chunk (current, increase, chunk)**

Receives the wallclock times an increases it according to a quantity times the number of the current chunk. The result cannot be larger than 48:00. If Chunk = 0 then no increment.

#### Parameters

- **current** (*str*) – WALLCLOCK HH:MM
- **increase** (*str*) – WCHUNKINC HH:MM
- **chunk** (*int*) – chunk number

**Returns** HH:MM wallclock

**Return type** str

**autosubmit.job.job\_common.parse\_output\_number (string\_number)**

Parses number in format 1.0K 1.0M 1.0G

**Parameters** **string\_number** (*str*) – String representation of number

**Returns** number in float format

**Return type** float

**class autosubmit.job.job\_list.JobList (expid, config, parser\_factory, job\_list\_persistence, as\_conf)**

Class to manage the list of jobs to be run by autosubmit

**add\_logs (logs)**

add logs to the current job\_list :return: logs :rtype: dict(tuple)

**backup\_load()**

Recreates a stored job list from the persistence

**Returns** loaded job list object

**Return type** *JobList*

**backup\_save()**

Persists the job list

**check\_scripts (as\_conf)**

When we have created the scripts, all parameters should have been substituted. %PARAMETER% handlers not allowed

**Parameters** **as\_conf** (*AutosubmitConfig*) – experiment configuration

**expid**

Returns the experiment identifier

**Returns** experiment's identifier

**Return type** str

**generate (date\_list, member\_list, num\_chunks, chunk\_ini, parameters, date\_format, default\_retrials, default\_job\_type, wrapper\_type=None, wrapper\_jobs={}, new=True, notransitive=False, update\_structure=False, run\_only\_members=[], show\_log=True, jobs\_data={}, as\_conf=’’)**

Creates all jobs needed for the current workflow

**Parameters**

- **default\_job\_type** (str) – default type for jobs
- **date\_list** (list) – start dates
- **member\_list** (list) – members
- **num\_chunks** (int) – number of chunks to run
- **chunk\_ini** (int) – the experiment will start by the given chunk
- **parameters** (dict) – experiment parameters
- **date\_format** (str) – option to format dates
- **default\_retrials** (int) – default retrials for each job
- **new** (bool) – is it a new generation?
- **wrapper\_type** – Type of wrapper defined by the user in **autosubmit\_.yml** [wrapper] section.
- **wrapper\_jobs** (String) – Job types defined in **autosubmit\_.yml** [wrapper sections] to be wrapped.

**get\_active (platform=None, wrapper=False)**

Returns a list of active jobs (In platforms queue + Ready)

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** active jobs

**Return type** list

**get\_all (platform=None, wrapper=False)**

Returns a list of all jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** all jobs

**Return type** list

**get\_chunk\_list()**

Get inner chunk list

**Returns** chunk list

**Return type** list

**get\_completed(*platform=None, wrapper=False*)**

Returns a list of completed jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** completed jobs

**Return type** list

**get\_date\_list()**

Get inner date list

**Returns** date list

**Return type** list

**get\_delayed(*platform=None*)**

Returns a list of delayed jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** delayed jobs

**Return type** list

**get\_failed(*platform=None, wrapper=False*)**

Returns a list of failed jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** failed jobs

**Return type** list

**get\_finished(*platform=None, wrapper=False*)**

Returns a list of jobs finished (Completed, Failed)

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** finished jobs

**Return type** list

**get\_held\_jobs(*platform=None*)**

Returns a list of jobs in the platforms (Held)

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** jobs in platforms

**Return type** list

**get\_in\_queue(*platform=None, wrapper=False*)**

Returns a list of jobs in the platforms (Submitted, Running, Queuing, Unknown,Held)

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** jobs in platforms

**Return type** list**get\_job\_by\_name** (*name*)

Returns the job that its name matches parameter name

**Parameters** **name** (*str*) – name to look for**Returns** found job**Return type** job**get\_job\_list** ()

Get inner job list

**Returns** job list**Return type** list**get\_job\_names** (*lower\_case=False*)

Returns a list of all job names :param: lower\_case: if true, returns lower case job names :type: lower\_case: bool

**Returns** all job names**Return type** list**get\_job\_related** (*select\_jobs\_by\_name=*, *select\_all\_jobs\_by\_section=*, *filter\_jobs\_by\_section=*, *two\_step\_start=True*)**Parameters**

- **select\_jobs\_by\_name** – job name
- **select\_all\_jobs\_by\_section** – section name
- **filter\_jobs\_by\_section** – section, date , member? , chunk?

**Returns** jobs\_list names**Return type** list**get\_jobs\_by\_section** (*section\_list*)

Returns the job that its name matches parameter section :parameter section\_list: list of sections to look for :type section\_list: list :return: found job :rtype: job

**get\_logs** ()

Returns a dict of logs by jobs\_name jobs

**Returns** logs**Return type** dict(tuple)**get\_member\_list** ()

Get inner member list

**Returns** member list**Return type** list**get\_not\_in\_queue** (*platform=None, wrapper=False*)

Returns a list of jobs NOT in the platforms (Ready, Waiting)

**Parameters** **platform** (*HPCPlatform*) – job platform**Returns** jobs not in platforms**Return type** list

**get\_ordered\_jobs\_by\_date\_member** (*section*)

Get the dictionary of jobs ordered according to wrapper's expression divided by date and member

**Returns** jobs ordered divided by date and member

**Return type** dict

**get\_prepared** (*platform=None*)

Returns a list of prepared jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** prepared jobs

**Return type** list

**get\_queuing** (*platform=None, wrapper=False*)

Returns a list of jobs queuing

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** queuedjobs

**Return type** list

**get\_ready** (*platform=None, hold=False, wrapper=False*)

Returns a list of ready jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** ready jobs

**Return type** list

**get\_running** (*platform=None, wrapper=False*)

Returns a list of jobs running

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** running jobs

**Return type** list

**get\_skipped** (*platform=None*)

Returns a list of skipped jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** skipped jobs

**Return type** list

**get\_submitted** (*platform=None, hold=False, wrapper=False*)

Returns a list of submitted jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** submitted jobs

**Return type** list

**get\_suspended** (*platform=None, wrapper=False*)

Returns a list of jobs on unknown state

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** unknown state jobs

**Return type** list

**get\_uncompleted** (*platform=None, wrapper=False*)

Returns a list of completed jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** completed jobs

**Return type** list

**get\_uncompleted\_and\_not\_waiting** (*platform=None, wrapper=False*)

Returns a list of completed jobs and waiting

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** completed jobs

**Return type** list

**get\_unknown** (*platform=None, wrapper=False*)

Returns a list of jobs on unknown state

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** unknown state jobs

**Return type** list

**get\_unsubmitted** (*platform=None, wrapper=False*)

Returns a list of unsubmitted jobs

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** all jobs

**Return type** list

**get\_waiting** (*platform=None, wrapper=False*)

Returns a list of jobs waiting

**Parameters** **platform** (*HPCPlatform*) – job platform

**Returns** waiting jobs

**Return type** list

**get\_waiting\_remote\_dependencies** (*platform\_type='slurm'*)

Returns a list of jobs waiting on slurm scheduler :param platform\_type: platform type :type platform\_type: str :return: waiting jobs :rtype: list

**graph**

Returns the graph

**Returns** graph

**Return type** networkx graph

**load()**

Recreates a stored job list from the persistence

**Returns** loaded job list object

**Return type** *JobList*

**static load\_file** (*filename*)

Recreates a stored joblist from the pickle file

**Parameters** **filename** (*str*) – pickle file to load

**Returns** loaded joblist object

**Return type** *JobList*

**parameters**

List of parameters common to all jobs :return: parameters :rtype: dict

**print\_with\_status** (*statusChange=None*, *nocolor=False*, *existingList=None*)

Returns the string representation of the dependency tree of the Job List

**Parameters**

- **statusChange** (*List of strings*) – List of changes in the list, supplied in set status
- **nocolor** (*Boolean*) – True if the result should not include color codes
- **existingList** (*List of Job Objects*) – External List of Jobs that will be printed, this excludes the inner list of jobs.

**Returns** String representation

**Return type** String

**remove\_rerun\_only\_jobs** (*notransitive=False*)

Removes all jobs to be run only in reruns

**rerun** (*job\_list\_unparsed*, *monitor=False*)

Updates job list to rerun the jobs specified by a job list :param job\_list\_unparsed: list of jobs to rerun :type job\_list\_unparsed: list :param monitor: if True, the job list will be monitored :type monitor: bool

**static retrieve\_packages** (*BasicConfig*, *expid*, *current\_jobs=None*)

Retrieves dictionaries that map the collection of packages in the experiment

**Parameters**

- **BasicConfig** (*Configuration Object*) – Basic configuration
- **expid** (*String*) – Experiment ID
- **current\_jobs** (*list*) – list of names of current jobs

**Returns** job to package, package to job, package to package\_id, package to symbol

**Return type** Dictionary(Job Object, Package), Dictionary(Package, List of Job Objects), Dictionary(String, String), Dictionary(String, String)

**static retrieve\_times** (*status\_code*, *name*, *tmp\_path*, *make\_exception=False*, *job\_times=None*, *seconds=False*, *job\_data\_collection=None*)

Retrieve job timestamps from database. :param status\_code: Code of the Status of the job :type status\_code: Integer :param name: Name of the job :type name: String :param tmp\_path: Path to the tmp folder of the experiment :type tmp\_path: String :param make\_exception: flag for testing purposes :type make\_exception: Boolean :param job\_times: Detail from as\_times.job\_times for the experiment :type job\_times: Dictionary Key: job name, Value: 5-tuple (submit time, start time, finish time, status, detail id) :return: minutes the job has been queuing, minutes the job has been running, and the text that represents it :rtype: int, int, str

**save ()**

Persists the job list

**sort\_by\_id ()**

Returns a list of jobs sorted by id

**Returns** jobs sorted by ID

**Return type** list

---

```
sort_by_name()
    Returns a list of jobs sorted by name
        Returns jobs sorted by name
        Return type list

sort_by_status()
    Returns a list of jobs sorted by status
        Returns job sorted by status
        Return type list

sort_by_type()
    Returns a list of jobs sorted by type
        Returns job sorted by type
        Return type list

update_from_file(store_change=True)
    Updates jobs list on the fly from and update file :param store_change: if True, renames the update file to
    avoid reloading it at the next iteration

update_genealogy(new=True, nottransitive=False, update_structure=False)
    When we have created the job list, every type of job is created. Update genealogy remove jobs that have
    no templates :param new: if it is a new job list or not :type new: bool

update_list(as_conf, store_change=True, fromSetStatus=False, submitter=None, first_time=False)
    Updates job list, resetting failed jobs and changing to READY all WAITING jobs with all parents COM-
    PLETED
        Parameters as_conf (AutosubmitConfig) – autosubmit config object
        Returns True if job status were modified, False otherwise
        Return type bool
```

## 13.6 autosubmit.monitor

```
class autosubmit.monitor.monitor.Monitor
    Class to handle monitoring of Jobs at HPC.

    static clean_plot(expid)
        Function to clean space on BasicConfig.LOCAL_ROOT_DIR/plot directory. Removes all plots except last
        two.
            Parameters expid (str) – experiment's identifier

    static clean_stats(expid)
        Function to clean space on BasicConfig.LOCAL_ROOT_DIR/plot directory. Removes all stats' plots
        except last two.
            Parameters expid (str) – experiment's identifier

    static color_status(status)
        Return color associated to given status
            Parameters status (Status) – status
            Returns color
```

**Return type** str

**create\_tree\_list** (expid, joblist, packages, groups, hide\_groups=False)  
Create graph from joblist

**Parameters**

- **expid** (str) – experiment's identifier
- **joblist** (JobList) – joblist to plot

**Returns** created graph

**Return type** pydotplus.Dot

**generate\_output** (expid, joblist, path, output\_format='pdf', packages=None, show=False, groups={}, hide\_groups=False, job\_list\_object=None)  
Plots graph for joblist and stores it in a file

**Parameters**

- **expid** (str) – experiment's identifier
- **joblist** (List of Job objects) – list of jobs to plot
- **output\_format** (str (png, pdf, ps)) – file format for plot
- **show** (bool) – if true, will open the new plot with the default viewer
- **job\_list\_object** (JobList object) – Object that has the main txt generation method

**generate\_output\_stats** (expid, joblist, output\_format='pdf', period\_ini=None, period\_fi=None, show=False, queue\_time\_fixes=None)  
Plots stats for joblist and stores it in a file

**Parameters**

- **expid** (str) – experiment's identifier
- **joblist** (JobList) – joblist to plot
- **output\_format** (str (png, pdf, ps)) – file format for plot
- **period\_ini** (datetime) – initial datetime of filtered period
- **period\_fi** (datetime) – final datetime of filtered period
- **show** (bool) – if true, will open the new plot with the default viewer

**generate\_output\_txt** (expid, joblist, path, classictxt=False, job\_list\_object=None)

Function that generates a representation of the jobs in a txt file  
:param expid: experiment's identifier :type expid: str  
:param joblist: experiment's list of jobs :type joblist: list  
:param job\_list\_object: Object that has the main txt generation method :type job\_list\_object: JobList object

**static get\_general\_stats** (expid)

Returns all the options in the sections of the %expid%\_GENERAL\_STATS. Options with values larger than GENERAL\_STATS\_OPTION\_MAX\_LENGTH characters are not added.

**Parameters** **expid** (str) – experiment's identifier

**Returns** list of tuples (section, ''), (option, value), (option, value), (section, ''), (option, value), ...

**Return type** list

## 13.7 autosubmit.platform

```
class autosubmit.platforms.ecplatform.EcPlatform(expid, name, config, scheduler)
Bases: autosubmit.platforms.paramiko_platform.ParamikoPlatform

Class to manage queues with ecaccess

Parameters

- expid (str) – experiment's identifier
- scheduler (str (pbs, loadleveler)) – scheduler to use

check_all_jobs (job_list, as_conf, retries=5)
Checks jobs running status :param job_list: list of jobs :type job_list: list :param as_conf: autosubmit configuration :type as_conf: autosubmit.config.config.Config :param retries: retries :type retries: int :return: list of jobs with their status :rtype: list

connect()
In this case, it does nothing because connection is established for each command

Returns True

Return type bool

delete_file (filename)
Deletes a file from this platform

Parameters filename (str) – file name

Returns True if successful or file does not exist

Return type bool

get_check_job_cmd (job_id)
Returns command to check job status on remote platforms

Parameters

- job_id – id of job to check
- job_id – int

Returns command to check job status

Return type str

get_file (filename, must_exist=True, relative_path='', ignore_log=False, wrapper_failed=False)
Copies a file from the current platform to experiment's tmp folder

Parameters

- filename (str) – file name
- must_exist (bool) – If True, raises an exception if file can not be copied
- relative_path (str) – path inside the tmp folder

Returns True if file is copied successfully, false otherwise

Return type bool

get_mkdir_cmd()
Gets command to create directories on HPC

Returns command to create directories on HPC
```

**Return type** str

**get\_ssh\_output()**

Gets output from last command executed

**Returns** output from last command

**Return type** str

**get\_submit\_cmd(job\_script, job, hold=False, export="")**

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status
- **hold** – boolean
- **export** – modules that should've downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id(output, x11=False)**

Parses submit command output to extract job id :param output: output to parse :type output: str :return: job id :rtype: str

**jobs\_in\_queue()**

Returns empty list because ecacces does not support this command

**Returns** empty list

**Return type** list

**move\_file(src, dest, must\_exist=False)**

Moves a file on the platform (includes .err and .out) :param src: source name :type src: str :param dest: destination name :param must\_exist: ignore if file exist or not :type dest: str

**parse\_job\_output(output)**

Parses check job command output, so it can be interpreted by autosubmit

**Parameters** **output** (str) – output to parse

**Returns** job status

**Return type** str

**restore\_connection()**

In this case, it does nothing because connection is established for each command

**Returns** True

**Return type** bool

**send\_command(command, ignore\_log=False, x11=False)**

Sends given command to HPC

**Parameters** **command** (str) – command to send

**Returns** True if executed, False if failed

**Return type** bool

**send\_file** (*filename*, *check=True*)

Sends a local file to the platform :param filename: name of the file to send :type filename: str

**test\_connection()**

In this case, it does nothing because connection is established for each command

**Returns** True

**Return type** bool

**update\_cmds()**

Updates commands for platforms

**class** autosubmit.platforms.lsfplatform.**LsfPlatform** (*expid*, *name*, *config*)

Bases: autosubmit.platforms.paramiko\_platform.ParamikoPlatform

Class to manage jobs to host using LSF scheduler

**Parameters** **expid** (str) – experiment’s identifier

**check\_all\_jobs** (*job\_list*, *as\_conf*, *retries=5*)

Checks jobs running status :param job\_list: list of jobs :type job\_list: list :param as\_conf: autosubmit configuration :type as\_conf: autosubmit.config.Config :param retries: retries :type retries: int :return: list of jobs with their status :rtype: list

**get\_check\_job\_cmd** (*job\_id*)

Returns command to check job status on remote platforms

**Parameters**

- **job\_id** – id of job to check
- **job\_id** – int

**Returns** command to check job status

**Return type** str

**get\_mkdir\_cmd()**

Gets command to create directories on HPC

**Returns** command to create directories on HPC

**Return type** str

**get\_submit\_cmd** (*job\_script*, *job*, *export=”*)

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status
- **hold** – boolean
- **export** – modules that should’ve downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id**(*output*, *x11=False*)

Parses submit command output to extract job id :param *output*: output to parse :type *output*: str :return: job id :rtype: str

**parse\_job\_output**(*output*)

Parses check job command output, so it can be interpreted by autosubmit

**Parameters** *output* (str) – output to parse

**Returns** job status

**Return type** str

**update\_cmds**()

Updates commands for platforms

**class** autosubmit.platforms.pbsplatform.**PBSPlatform**(*expid*, *name*, *config*, *version*)

Bases: autosubmit.platforms.paramiko\_platform.ParamikoPlatform

Class to manage jobs to host using PBS scheduler

**Parameters**

- **expid** (str) – experiment's identifier
- **version** (str) – scheduler version

**check\_Alljobs**(*job\_list*, *as\_conf*, *retries=5*)

Checks jobs running status :param *job\_list*: list of jobs :type *job\_list*: list :param *as\_conf*: autosubmit configuration :type *as\_conf*: autosubmit.config.config.Config :param *retries*: retries :type *retries*: int :return: list of jobs with their status :rtype: list

**get\_checkjob\_cmd**(*job\_id*)

Returns command to check job status on remote platforms

**Parameters**

- **job\_id** – id of job to check
- **job\_id** – int

**Returns** command to check job status

**Return type** str

**get\_mkdir\_cmd**()

Gets command to create directories on HPC

**Returns** command to create directories on HPC

**Return type** str

**get\_submit\_cmd**(*job\_script*, *job*, *export=""*)

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status

- **hold** – boolean
- **export** – modules that should've downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id**(*output*, *x11=False*)

Parses submit command output to extract job id :param *output*: output to parse :type *output*: str :return: job id :rtype: str

**parse\_job\_output**(*output*)

Parses check job command output, so it can be interpreted by autosubmit

**Parameters** **output** (str) – output to parse

**Returns** job status

**Return type** str

**update\_cmds**()

Updates commands for platforms

**class** autosubmit.platforms.sgeplatform.**SgePlatform**(*expid*, *name*, *config*)

Bases: autosubmit.platforms.paramiko\_platform.ParamikoPlatform

Class to manage jobs to host using SGE scheduler

**Parameters** **expid**(str) – experiment's identifier

**check\_all\_jobs**(*job\_list*, *as\_conf*, *retries=5*)

Checks jobs running status :param *job\_list*: list of jobs :type *job\_list*: list :param *as\_conf*: autosubmit configuration :type *as\_conf*: autosubmit.config.Config :param *retries*: retries :type *retries*: int :return: list of jobs with their status :rtype: list

**connect**()

In this case, it does nothing because connection is established for each command

**Returns** True

**Return type** bool

**get\_check\_job\_cmd**(*job\_id*)

Returns command to check job status on remote platforms

**Parameters**

- **job\_id** – id of job to check
- **job\_id** – int

**Returns** command to check job status

**Return type** str

**get\_mkdir\_cmd**()

Gets command to create directories on HPC

**Returns** command to create directories on HPC

**Return type** str

**get\_submit\_cmd**(*job\_script*, *job*, *export=""*)

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status
- **hold** – boolean
- **export** – modules that should've downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id**(*output*, *x11=False*)

Parses submit command output to extract job id :param *output*: output to parse :type *output*: str :return: job id :rtype: str

**parse\_job\_output**(*output*)

Parses check job command output, so it can be interpreted by autosubmit

**Parameters** **output** (str) – output to parse

**Returns** job status

**Return type** str

**restore\_connection**()

In this case, it does nothing because connection is established for each command

**Returns** True

**Return type** bool

**test\_connection**()

In this case, it does nothing because connection is established for each command

**Returns** True

**Return type** bool

**update\_cmds**()

Updates commands for platforms

**class** autosubmit.platforms.slurmplatform.**SlurmPlatform**(*expid*, *name*, *config*)

Bases: autosubmit.platforms.paramiko\_platform.ParamikoPlatform

Class to manage jobs to host using SLURM scheduler

**Parameters** **expid** (str) – experiment's identifier

**get\_checkAllJobs\_cmd**(*jobs\_id*)

Returns command to check jobs status on remote platforms

**Parameters**

- **jobs\_id** – id of jobs to check
- **jobs\_id** – str

**Returns** command to check job status

**Return type** str

**get\_check\_job\_cmd (job\_id)**

Returns command to check job status on remote platforms

**Parameters**

- **job\_id** – id of job to check
- **job\_id** – int

**Returns** command to check job status

**Return type** str

**get\_mkdir\_cmd ()**

Gets command to create directories on HPC

**Returns** command to create directories on HPC

**Return type** str

**get\_submit\_cmd (job\_script, job, hold=False, export="")**

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status
- **hold** – boolean
- **export** – modules that should've downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id (outputlines, x11=False)**

Parses submit command output to extract job id :param output: output to parse :type output: str :return: job id :rtype: str

**open\_submit\_script ()**

Opens Submit script file

**parse\_All\_jobs\_output (output, job\_id)**

Parses check jobs command output, so it can be interpreted by autosubmit :param output: output to parse :param job\_id: select the job to parse :type output: str :return: job status :rtype: str

**parse\_job\_finish\_data (output, packed)**

Parses the context of the sacct query to SLURM for a single job. Only normal jobs return submit, start, finish, joules, ncpus, nnodes.

When a wrapper has finished, capture finish time.

**Parameters**

- **output** (str) – The sacct output
- **packed** (bool) – true if job belongs to package

**Returns** submit, start, finish, joules, ncpus, nnodes, detailed\_data

**Return type** int, int, int, int, int, int, json object (str)

**parse\_job\_output** (*output*)  
Parses check job command output, so it can be interpreted by autosubmit

**Parameters** **output** (*str*) – output to parse

**Returns** job status

**Return type** str

**submit\_Script** (*hold=False*)  
Sends a Submit file Script, execute it in the platform and retrieves the Jobs\_ID of all jobs at once.

**Parameters** **hold** (*bool*) – if True, the job will be held

**Returns** job id for submitted jobs

**Return type** list(str)

**update\_cmds** ()  
Updates commands for platforms

**class** autosubmit.platforms.loclplatform.**LocalPlatform** (*expid, name, config*)  
Bases: autosubmit.platforms.paramiko\_platform.ParamikoPlatform

Class to manage jobs to localhost

**Parameters** **expid** (*str*) – experiment's identifier

**check\_Alljobs** (*job\_list, as\_conf, retries=5*)  
Checks jobs running status :param job\_list: list of jobs :type job\_list: list :param as\_conf: autosubmit configuration :type as\_conf: autosubmit.config.config.Config :param retries: retries :type retries: int :return: list of jobs with their status :rtype: list

**check\_file\_exists** (*src, wrapper\_failed=False*)  
Moves a file on the platform :param src: source name :type src: str :param: wrapper\_failed: if True, the wrapper failed. :type wrapper\_failed: bool

**connect** ()  
Creates ssh connection to host

**Returns** True if connection is created, False otherwise

**Return type** bool

**delete\_file** (*filename, del\_cmd=False*)  
Deletes a file from this platform

**Parameters** **filename** (*str*) – file name

**Returns** True if successful or file does no exist

**Return type** bool

**get\_checkjob\_cmd** (*job\_id*)  
Returns command to check job status on remote platforms

**Parameters**

- **job\_id** – id of job to check
- **job\_id** – int

**Returns** command to check job status

**Return type** str

**get\_file** (*filename*, *must\_exist=True*, *relative\_path=""*, *ignore\_log=False*, *wrapper\_failed=False*)

Copies a file from the current platform to experiment's tmp folder

**Parameters**

- **filename** (*str*) – file name
- **must\_exist** (*bool*) – If True, raises an exception if file can not be copied
- **relative\_path** (*str*) – path inside the tmp folder

**Returns** True if file is copied successfully, false otherwise

**Return type** bool

**get\_logs\_files** (*exp\_id*, *remote\_logs*)

Overriding the parent's implementation. Do nothing because the log files are already in the local platform (redundancy).

**Parameters**

- **exp\_id** (*str*) – experiment id
- **remote\_logs** ((*str*, *str*)) – names of the log files

**get\_mkdir\_cmd()**

Gets command to create directories on HPC

**Returns** command to create directories on HPC

**Return type** str

**get\_ssh\_output()**

Gets output from last command executed

**Returns** output from last command

**Return type** str

**get\_submit\_cmd** (*job\_script*, *job*, *hold=False*, *export=""*)

Get command to add job to scheduler

**Parameters**

- **job\_type** –
- **job\_script** – path to job script
- **job\_script** – str
- **hold** – submit a job in a held status
- **hold** – boolean
- **export** – modules that should've downloaded
- **export** – string

**Returns** command to submit job to platforms

**Return type** str

**get\_submitted\_job\_id** (*output*, *x11=False*)

Parses submit command output to extract job id :param output: output to parse :type output: str :return: job id :rtype: str

**move\_file** (*src, dest, must\_exist=False*)

Moves a file on the platform (includes .err and .out) :param src: source name :type src: str :param dest: destination name :param must\_exist: ignore if file exist or not :type dest: str

**parse\_job\_output** (*output*)

Parses check job command output, so it can be interpreted by autosubmit

**Parameters** **output** (*str*) – output to parse

**Returns** job status

**Return type** str

**send\_command** (*command, ignore\_log=False, x11=False*)

Sends given command to HPC

**Parameters** **command** (*str*) – command to send

**Returns** True if executed, False if failed

**Return type** bool

**send\_file** (*filename*)

Sends a local file to the platform :param filename: name of the file to send :type filename: str

**test\_connection()**

Test if the connection is still alive, reconnect if not.

**update\_cmds()**

Updates commands for platforms

# CHAPTER 14

## Autosubmit GUI

### 14.1 Autosubmit GUI Main Page

Inside the Barcelona Supercomputing Internal Network you can find the latest version of Autosubmit GUI deployed for BSC users. It can be accessed by following the url <http://bscesweb04.bsc.es/autosubmitapp/> or <https://earth.bsc.es/autosubmitapp/>. This is a graphic user interface that allows you to easily monitor your experiments and those of your colleagues. This Web App introduces many useful features for experiment monitoring, and we are continuously improving it.

---

**Note:** The Web App can also be accessed through the VPN Client provided by BSC.

---

When you enter the site, you will be presented with the following page:

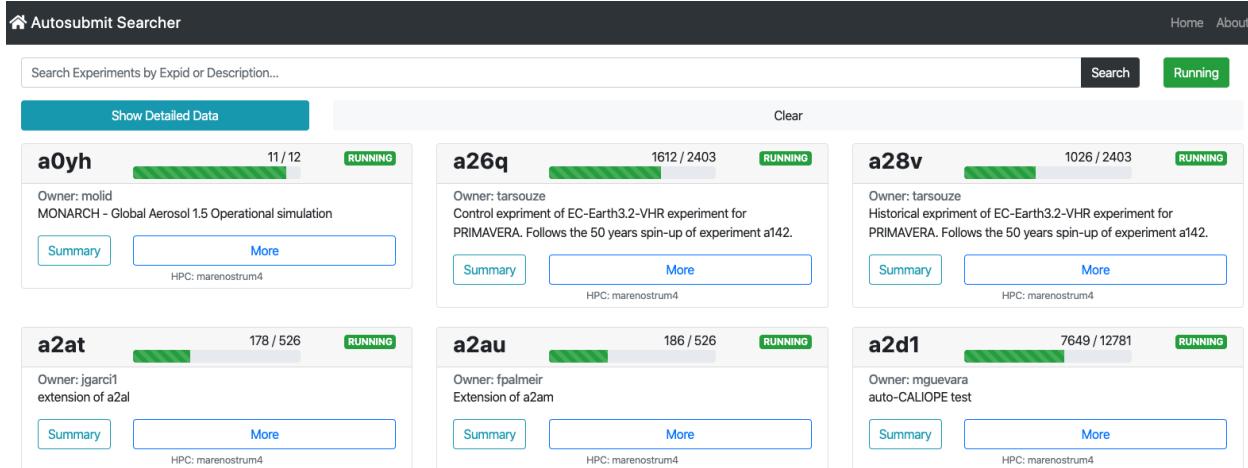

14.1: Welcome page

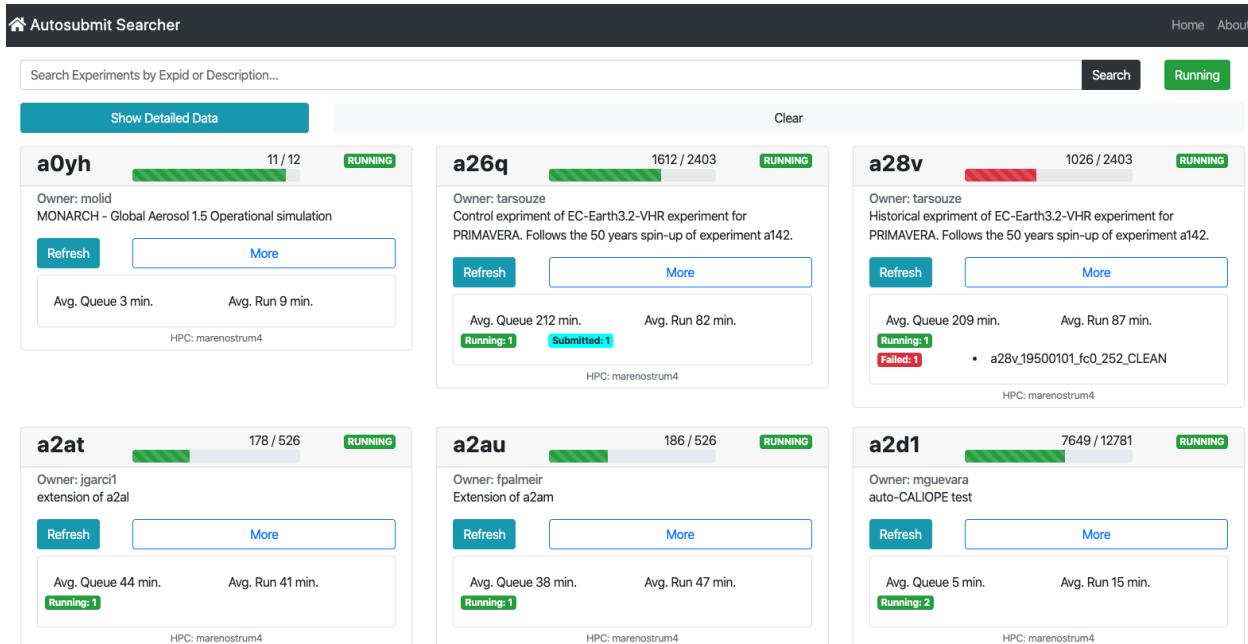

Here you can search for any ongoing or past experiment by typing some text in the Search input box and pressing **Search**: the search engine will look for coincidences between your input string and any of the description, owner or name of the experiment fields. The results will be shown below ordered by status, experiments RUNNING will be shown in the first rows. You can also click on the Running button, and all the experiments that are currently running will be listed. The results will look like:

If you click on Show Detailed Data, summary data for each experiment (result) will be loaded. These are data details from the experiment run, useful to see its status at a glance. Progress bars and status will use different colors to highlight the important information.

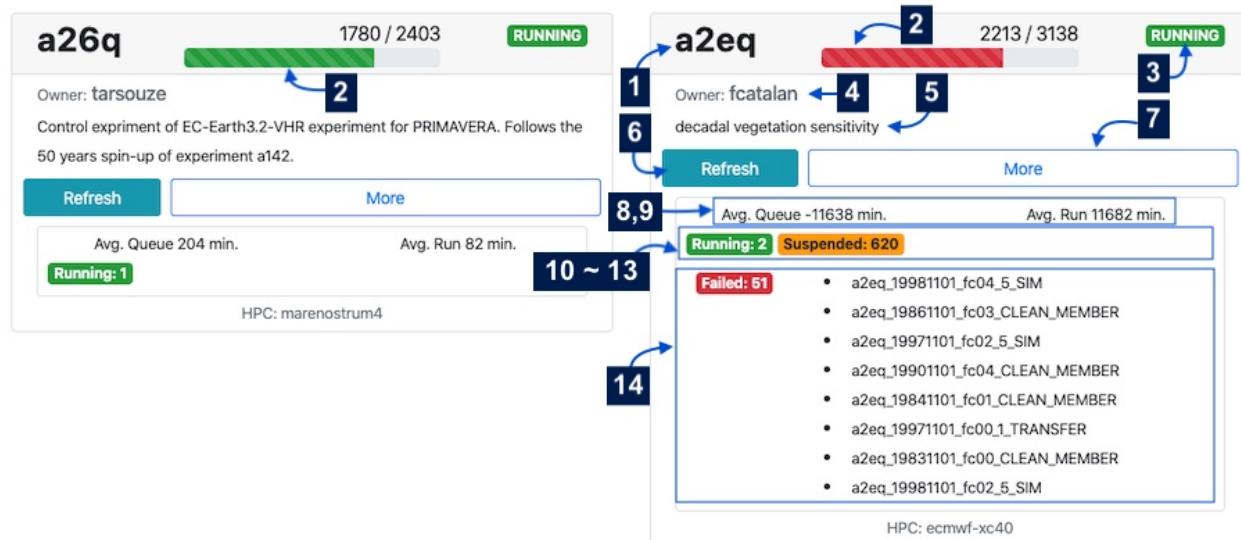

For each experiment, you see the following data:

### 14.2: Search Result

### 14.3: Search Result plus Detailed Data

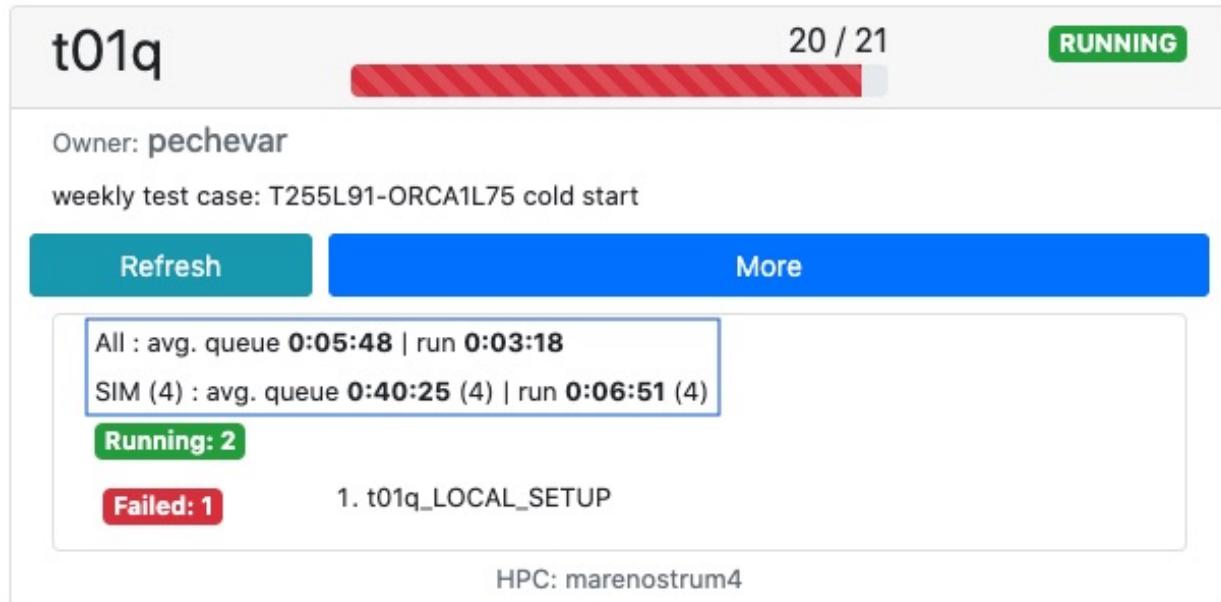

#### 14.4: Description of Detailed Data

1. *Experiment Name*
2. *Progress Bar*: Shows completed jobs / total jobs. It turns red when there are **failed** jobs in the experiment, but **Show Detailed Data** should have been requested.
3. *Experiment Status*: **RUNNING** or **NOT RUNNING**.
4. *Owner*
5. *Experiment Description*
6. *Refresh button*: It will say *Summary* when the detailed data has not been requested. If it says *Summary* and you click on it, it will load detailed data for that experiment, otherwise it will refresh the existing detailed data.
7. *More button*: Opens the **Experiment Page**.
8. *Average Queue Time* for all jobs.
9. *Average Run Time* for all jobs.
10. *Number of Running Jobs*
11. *Number of Queuing Jobs*
12. *Number of Submitted Jobs*
13. *Number of Suspended Jobs*
14. *Number of Failed Jobs*: If there are Failed jobs, a list of the names of those jobs will be displayed.

In experiments that include **SIM** jobs, you will also see the average queuing and running time for these jobs. In the latest version the time format has been updated to **HH:mm:ss**. The text for the **SIM** average follows the format **avg. queue HH:mm:ss (M) | run HH:mm:ss (N)** where **M** is the number of jobs considered for the **avg. queue** calculation and **N** is the number of jobs considered for **run** calculation.

After clicking on the **MORE** button, you will be presented with the **Experiment Page**, which is the main view that Autosubmit provides. These are its main components:

#### 14.5: Average Times Feature

##### 14.1.1 Experiment Information

This component offers the main information about your experiment.

At the top left you see the `Autosubmit Searcher` home link that will take you back to the [Autosubmit GUI Main Page](#), next to it you see the `Home` link that serves the same purpose, then you see the `About` link that takes you to a page with important information about the application (including the link to this documentation). Then you see the experiment name and `status`, which is updated every 5 minutes. Next, you see the `run history` button, this button opens a panel that shows information about previous runs of the experiment, only works for experiments running the latest version of Autosubmit. Then, you see the `esarchive status` badge, it shows information about the current status of the `esarchive` file system.

At the bottom you see some relevant metadata, including the `branch` of the `model` that was used in the experiment, the `HPC` name targeted by the experiment, the `owner`, the `version` that this experiment us running on, the `DB` version of Autosubmit, and the number of jobs in the experiment.

On the center you see the `Tree Representation`, which is loaded automatically when you open this page.

##### 14.1.2 Tree Representation

The Tree Representation offers a structured view of the experiment.

The view is organized in groups by `date`, and `date-member`. Each group has a folder icon, and next to the icon you can find the progress of the group as `completed / total` jobs (when all the jobs in a group have been completed, a check symbol will appear); then, an indicator of how many jobs inside that group are **RUNNING**, **QUEUING**, or have **FAILED**. Furthermore, if wrappers exist in the experiment, independent groups will be added for each wrapper that will contain the list of jobs included in the corresponding wrapper. This implies that a job can be repeated: once inside its `date-member` group and once in its wrapper group.

Inside each group you will find the list of jobs that belong to that group. The jobs are shown following this format: `job name + # job status + ( + queuing time + ) + running time`. Jobs that belong to a wrapper have also a badge with the code of the wrapper.

Finish: 2021-03-19 17:24:26

#### 14.7: Experiment Tree Representation

When you click on a Job, you can see on the right panel (**Selection Panel**) the following information:

- *Start*: Starting date.
- *End*: Ending date.
- *Section*: Also known as job type.
- *Member*
- *Chunk*
- *Platform*: Remote platform.
- *Id*: Id in the remote platform.
- *Processors*: Number of processors required by the job.
- *Wallclock*: Time requested by the job.
- *Queue*: Time spent in queue, in minutes.
- *Run*: Time spent running, in minutes.
- *Status*: Job status.
- *Out*: Button that opens a list of jobs that depend on the one selected.
- *In*: Button that opens a list of jobs on which the selected job depends.
- *out path*: Path to the .out log file.
- *err path*: Path to the .err log file.
- *Submit*: Submit time of the job (If applicable).
- *Start*: Start time of the job (If applicable).
- *Finish*: Finish time of the job (If applicable).

---

**Important:** Next to the **out** and **err** paths, you see the a **Copy out/err** button that copies the path to your clipboard. Then you see an **eye** symbol button, that when clicked will show that last 150 lines of the **out/err** file.

---

## Selection

When you click on a job in the tree view, a **Change Status** button will appear in the top bar, if you click, you will be presented with the option to generate a change status command that can be run on autosubmit, or to generate a format that can be used to change the status of the job while the experiment is running.

You can select many jobs at the same time by maintaining **CTRL** pressed and clicking on the jobs, then the generated command will include all these jobs.

## Monitoring

If the experiment status is **RUNNING**, you will see a button called **Refresh** at the top right corner. This button will update the information of the jobs in the tree if necessary. Next to this button, you will see the button **Start Job Monitor**. When you click on it, a live **Job Monitor** will be initialized and the status of the jobs and wrappers will be queried every minute, any change will be updated in the **Tree View**. Also, if the **Job Monitor** is running, the detected changes will be listed in a panel **Monitor Panel** below the **Selection Panel**. You can stop this process by clicking on the button **Stop Job Monitor**.

The button **Clear Tree View** will clear the Tree Representation. It is also a valid way to refresh the Tree View.

## Filter

At the top left you can find the **Filter** text input box. Insert any string and the list will show only those jobs whose description coincides with that string. For example `#COMPLETED` will show only completed jobs, `Wrapped` will show only those jobs that belong to a wrapper, `_fc0_` will show only those jobs that belong to the fc0 member. Press **Clear** to reset the filter. On the right side of this bar, you will see the total number of jobs, and the chunk unit used in the experiment.

## Advanced Filter

It is possible to use the key char `*` to separate keywords in the name of the job, in order. For example:

- `1850*fc0*_1_`: List all the jobs that have the string `1850` and then at least 1 occurrence of the string `fc0` and then at least 1 occurrence of the string `_1_`. This will effectively list all the jobs for the DATE that starts with `1850` for the member `fc0` and the chunk `_1_`.
- `000*_5`: List all the jobs that have the string `000` followed by at least one occurrence of the string `_5`. This will effectively list all the jobs that have member `000` and chunk number that starts with the digit `5`.
- `000*_5*PREPROCVAR`: It will also add the filter for jobs of type `PREPROCVAR`.

As you might infer, the logic is fairly straightforward: Start your string with the word or part of the word you are looking for, then add `*` and the word or part of the word that follows, and so on. The algorithm will split your string by `*` and then search for each part in order, once it finds the part in the title of the job, it takes a substring of the job title to not repeat the next search in the same string, it continues looking for the next part in the new reduced string, and so on.

You can extend this functionality considering that date, member, section, chunk names start with the symbol `_` and finish with the same symbol.

---

**Important:** This view is designed to show a structured view of your experiment, if you want a more dependency oriented view that shows better the execution sequence of your jobs, you can refer to [Graph Representation](#).

---

### 14.1.3 Graph Representation

The Graph Representation of the experiment offers a dependency oriented view.

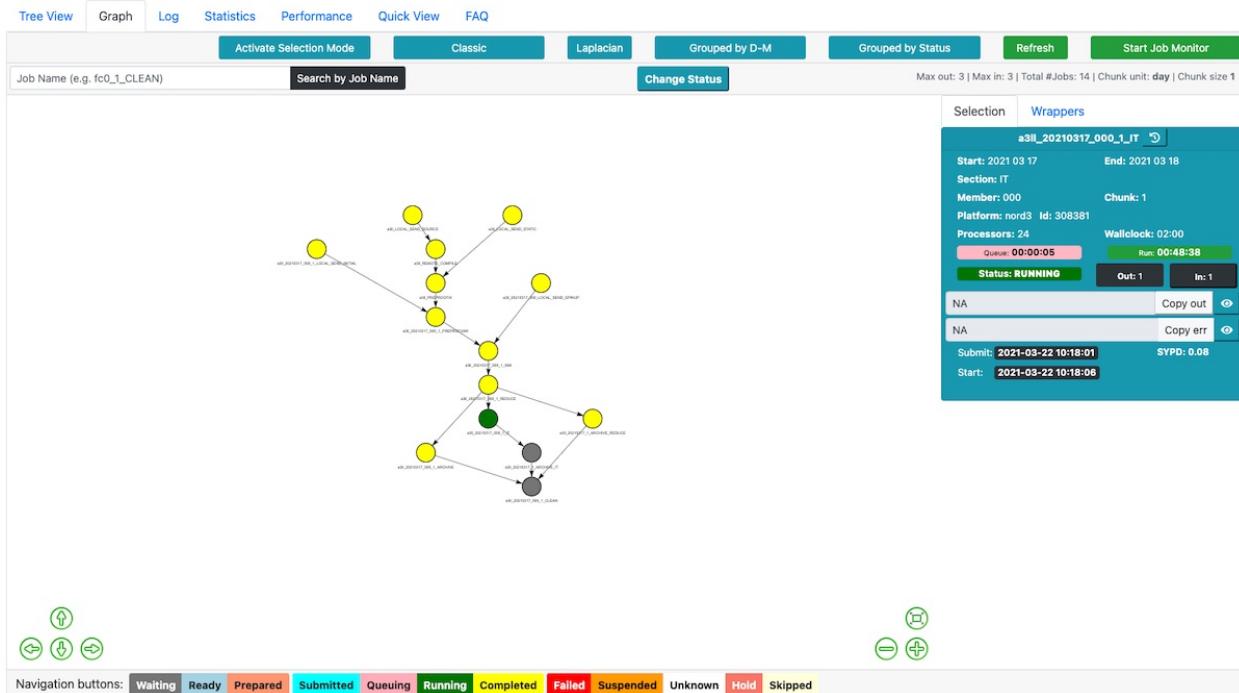

This view offers a graph representation of the experiments where a node represents a job and an edge represents a directed dependency relationship between nodes. To open it you must click on the button `Classic`, which is the basic representation that uses either `GraphViz` or an heuristic approach depending on experiment complexity; we explain the other options later.

Once the graph representation is loaded, it will focus on a relevant node according to some established rules. The color of each node represents the status of the job it represents: you can see a color guide at the bottom of the page in the form of buttons. If you click in any of those buttons, the graph will focus on the last node with that status, except in the case of `WAITING` where the graph will focus on the first one. You can navigate the graph in this way, but there are other navigation buttons at the left and right corners of the graph canvas. You can also use your mouse or trackpad to navigate the graph, zoom in or zoom out. Below each node you can see the job name of the job it represents.

---

**Important:** For some experiments you will get a well distributed and generally good looking graph representation, for others you get a more straightforward representation. It depends on the size and dependency complexity of your experiments, not all experiments can be modeled as a good looking graph in reasonable time.

---

14.8: Experiment Graph Representation

When you click on a node, you can see on the right panel (**Selection Panel**) the following information:

- *Start*: Starting date.
- *End*: Ending date.
- *Section*: Also known as job type.
- *Member*
- *Chunk*
- *Platform*: Remote platform.
- *Id*: Id in the remote platform.
- *Processors*: Number of processors required by the job.
- *Wallclock*: Time requested by the job.
- *Queue*: Time spent in queue, in minutes.
- *Run*: Time spent running, in minutes.
- *Status*: Job status.
- *Out*: Button that opens a list of jobs that depend on the one selected.
- *In*: Button that opens a list of jobs on which the selected job depends.
- *out path*: Path to the .out log file.
- *err path*: Path to the .err log file.
- *Submit*: Submit time of the job (If applicable).
- *Start*: Start time of the job (If applicable).

- *Finish:* Finish time of the job (If applicable).

**Important:** Next to the **out** and **err** paths, you see the a **Copy out/err** button that copies the path to your clipboard. Then you see an **eye symbol** button, that when clicked will show that last 150 lines of the **out/err** file.

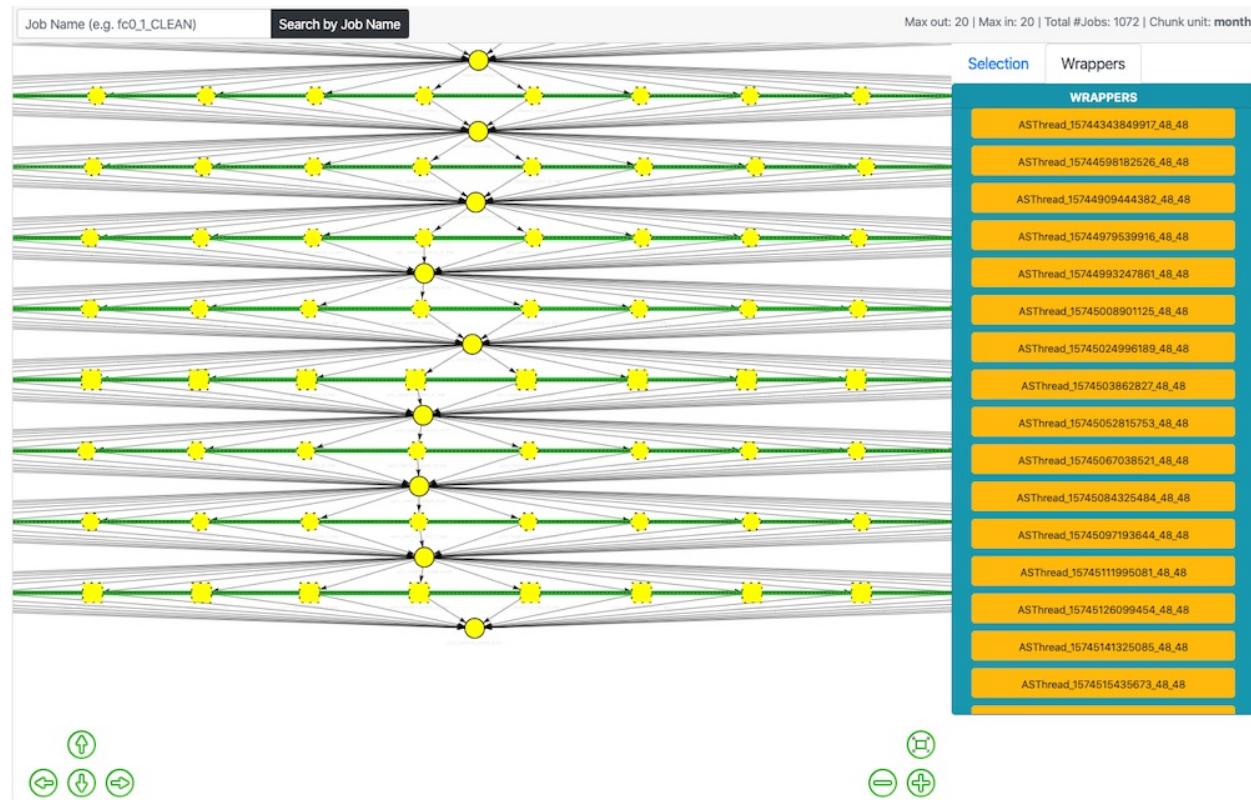

## Selection

When you click on a node in the tree view, a **Change Status** button will appear in the top bar, if you click, you will be presented with the option to generate a change status command that can be run on autosubmit, or to generate a format that can be used to change the status of the job while the experiment is running.

You can select many nodes at the same time by maintaining CTRL pressed and clicking on the nodes, then the generated command will include all these jobs.

## Wrappers Representation

Wrappers are an important feature of Autosubmit, and as such, it should be possible to visualize them in the graph representation.

14.9: Wrapper Graph Representation

Wrappers are represented by nodes that have dashed border, hexagon or square shape (no difference between them), and that share green background edges. On the right side of the graph you can find the **Wrappers Tab** and it will display a list of the existing wrappers as buttons. If you click on any of these buttons, the nodes that belong to that wrapper will be highlighted.

## Monitoring

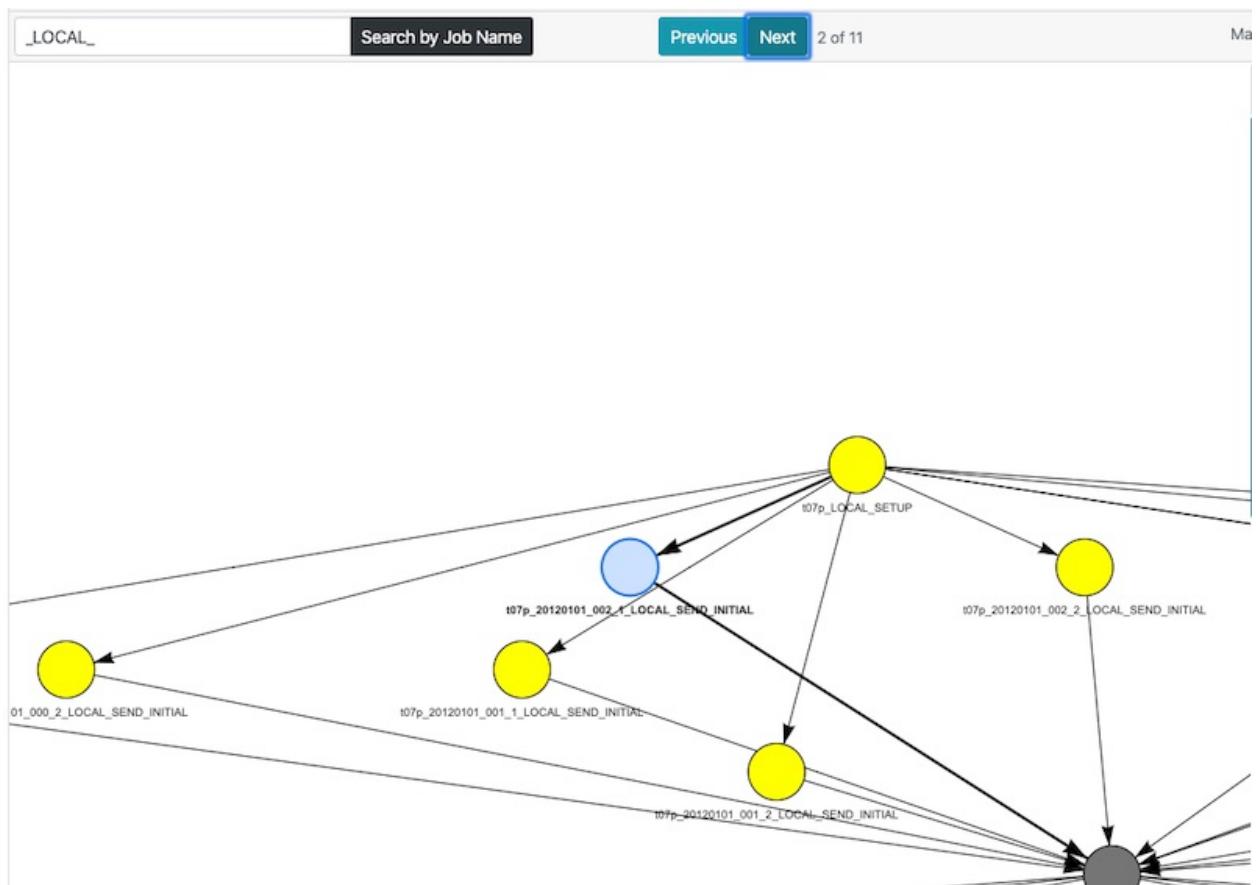

If the experiment is RUNNING you will see at the top right corner the button **Start Job Monitor**. When you click on it, a live **Job Monitor** will be initialized and the status of the jobs and wrappers will be queried every minute, any change will be updated in the graph. Also, if the **Job Monitor** is running, the detected changes will be listed in a panel **Monitor Panel** below the **Selection Panel**. You can stop this process by clicking on the button **Stop Job Monitor**.

---

**Important:** While this is a good option to monitor the progress of your experiment, you can also use the [Autosubmit Log](#).

---

## Job Search

14.10: Job Search in Graph

On top of the graph you will see an input text box following by the button **Search by Job Name**. Insert into that box the string that you want to find and the engine will build an internal list of those jobs whose name coincides with that string. For example `_LOCAL_` will show only jobs whose title contain the that string. Buttons **Previous** and **Next** will appear and next to them the number of jobs that coincide with your search, you can use these buttons to traverse the graph highlighting the nodes included in the resulting internal list.

## Grouped by Date Member

By clicking on the button **Grouped by D-M** you get a graph representation where the nodes are clustered by date and member. For example, if your experiment has only one starting date and one member, then you will have only one cluster in this view. These clusters are represented by rectangular boxes whose color gives a general idea of the status of the jobs inside it.

---

**Important:** You can double click on any cluster to “open” it, meaning that the nodes that belong to that cluster will be freed and positioned individually.

---

## Grouped by Status

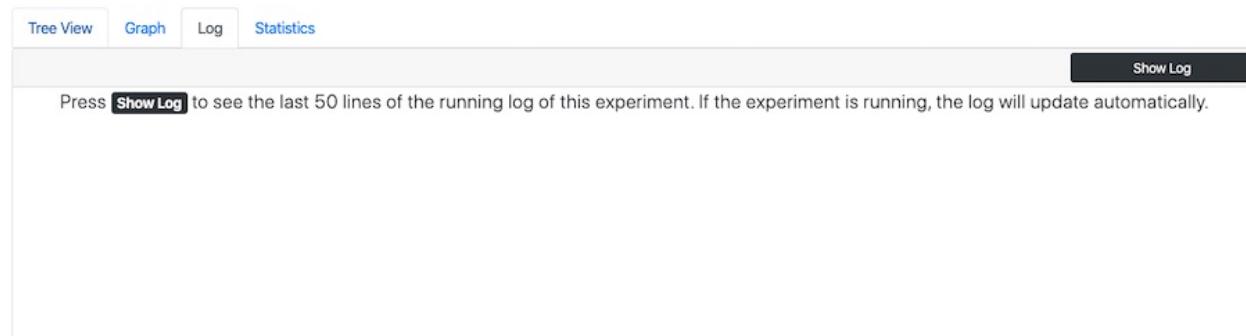

By clicking on the button **Grouped by Status** you get a graph representation where the nodes are clustered by status into 3 clusters: WAITING, COMPLETED, and SUSPENDED. Same rules mentioned for **Grouped by Date Member** apply.

## Laplacian

By clicking on the button **Laplacian** you get a graph representation where the  $(x, y)$  coordinates of each node are calculated based on the second and third smallest eigenvector of the Graph Laplacian. All functionality is supported.

### 14.1.4 Autosubmit Log

When you click on the **Log** tab, you will see the button **Show Log**:

14.11: Experiment Log

---

**Important:** The main Autosubmit log is usually stored in the folder `/tmp/` of your experiment, and this is the first path the system will scan.

---

When you click on the **Show Log** button, the last 150 lines of the log will be displayed:

At the top of the log you will see the name of the log file that is being displayed along with the timestamp of the last time the log was requested, and to the right you see this timestamp in `datetime` format.

If the experiment is currently running, the log will be updated periodically to keep you up with recent updates in the experiment execution. It is possible to scroll this view.

If you click on **Hide Log** the log will be cleared and the periodic updates will stop.

The screenshot shows a user interface for managing experiment logs. At the top, there are tabs: Tree View, Graph, Log (which is selected), and Statistics. Below the tabs is a large text area containing a log file named 20200324\_101849\_run.log. The log file contains numerous lines of text representing system activity, such as job status updates, parameter reloads, and command executions. A 'Hide Log' button is located in the top right corner of the log area. In the bottom right corner of the entire window, it says 'Last Modified: 2020-03-26 09:35:04'.

```

```

14.12: Experiment Log Open

### 14.1.5 Performance Metrics

The Performance Metrics tabs offers a set of metrics that try to measure the efficiency of the simulation performed, and other aspects of it.

On the left you have the values of the main performance metrics that apply to the experiment. Then, on the right, you see the list of jobs considered for this calculation with their data, also, SYPD and ASYPD are calculated individually for these jobs. This list is scrollable.

You can also access a Show warnings button that opens a list of important information that might affect the calculation of the metrics. You can click again on this button to close the list.

Further information about the metrics is included in the tab.

### 14.1.6 Autosubmit Statistics

When you click on the Statistics tab, you will see two input boxes: Section and Hours, followed by the button Get Statistics:

There is also a brief explanation of the input fields and expected result. Basically, Section allows you to narrow your search to certain job types, and Hours allows you to set a time limit to look into the past in hours.

In this example we have queried 3 hours into the past:

Click on the button Clear Statistics to clear the results and submit another query.

**Important:** For more details about Autosubmit statistics, refer to: autoStatistics.

Tree View   Graph   Log   Statistics   Performance   Quick View   FAQ   Refresh

There are some warnings about the calculations of performance metrics: Show warnings

Metrics description:

**Parallelization:** Total number of cores allocated for the run, per SIM.

**JPSY:** Energy cost of a simulation, measured in Joules per simulated year.

**SYPD:** Simulated years per day for the model in a 24 h period.

**ASYPD:** Actual SYPD, this number should be lower than SYPD due to interruptions, queue wait time, data transfer or issues with the model workflow. This is collected by measuring the time between first submission and the date of arrival of the last history file on the storage file system.

**CHSY:** Core hours per simulated year. This is measured as the product of the model runtime for 1 SY and the number of cores allocated. This is an average of the CHSY of all SIM jobs.

**Considered:** Scrollable list where each item in the list represents job information showing Job Name, QUEUE and RUNNING time in HH:mm:ss format, CHSY, JPSY, and raw Energy consumption for that job. Note: Energy values are only collected for those jobs running on MareNostrum4 and using the latest version of Autosubmit. Subsequent development will expand this feature for other platforms.

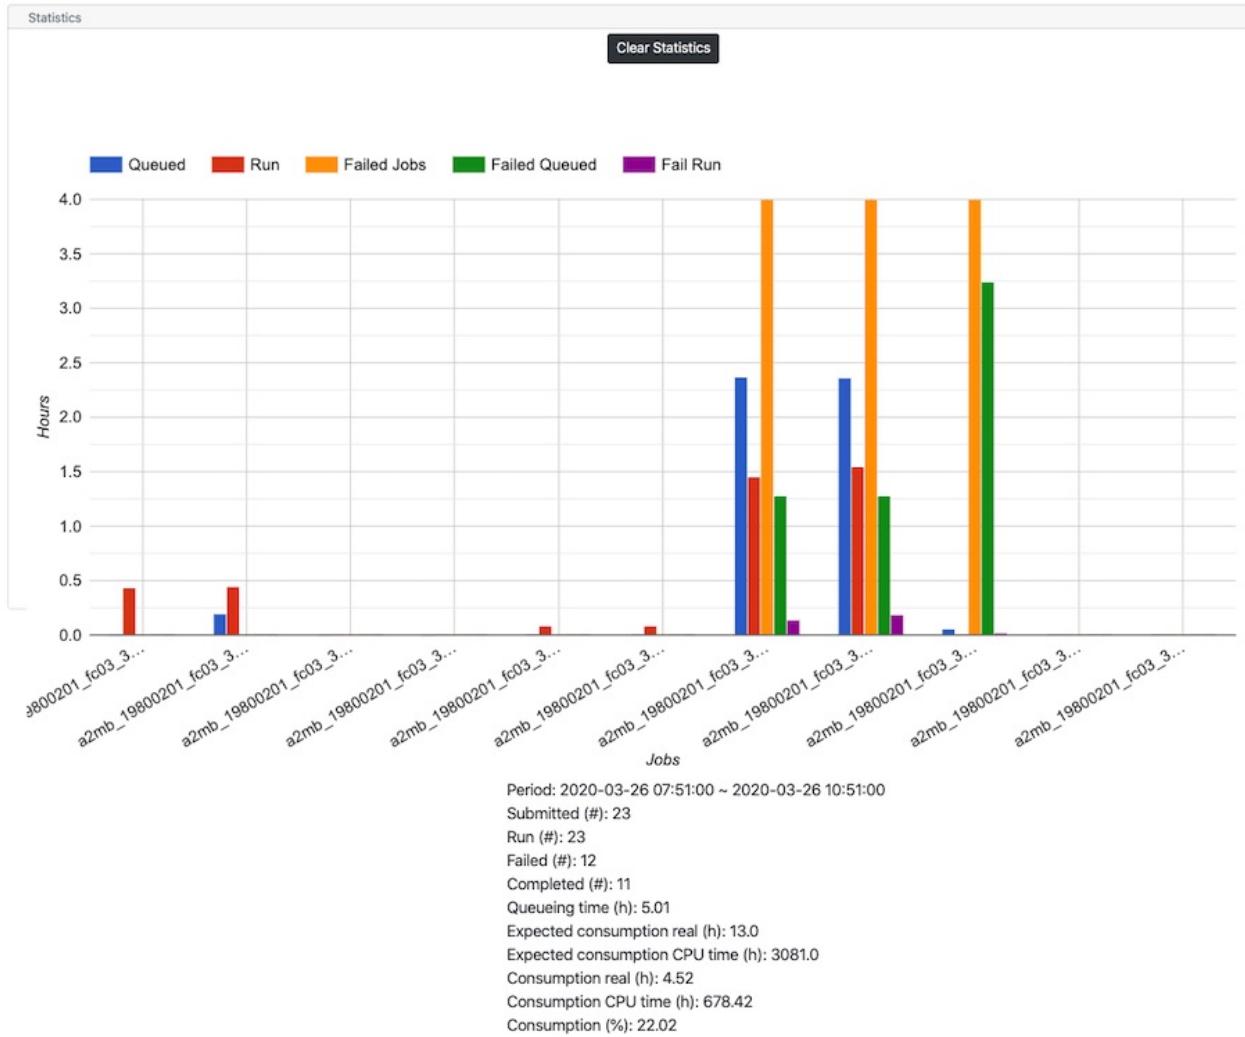

Visit [Performance Metrics Documentation](#) for more details.

### 14.13: Performance Metrics Tab

Tree View   Graph   Log   Statistics

Statistics				<span style="border: 1px solid #ccc; padding: 2px;">Get Statistics</span>
Section	Hours			
Supply a Section (Type) in the appropriate textbox to filter the jobs that will be included in the query. Also, you can also supply the Hours value that determines how many hours before the current time you want to query. Leave both empty and a query for Any Section since the date of creation of the experiment will be executed.				
Press <span style="border: 1px solid #ccc; padding: 2px;">Get Statistics</span> to generate the statistics, this will generate a Bar Chart and some extra statistics below. Drag the mouse inside the chart to zoom in; however, zoom in capabilities are not unlimited, so try to narrow your query.				

### 14.14: Experiment Statistics

14.15: Experiment Statistics (Last 3 hours)

---

**Important:** To improve response times, Autosubmit GUI will try to store the dependency structure of your experiment in a database file called `structure_expid.db` where `expid` is the name of your experiment. This file will be located in `/esarchive/autosubmit/expid/pkl/`.

---
